Subject:	Do not expand internet voting

Please do not expand internet voting.

According to leading computer experts, Internet voting is vulnerable to hacking and cyber-fraud. By definition it also appears that experts agree that "Internet voting" is any electronic transmission of a voted ballot or choices using the Internet.

While I understand you are doing everything within your power to make sure that military and overseas voters have the opportunity to vote, I do not believe that exposing military ballots to security risks and hackers will ultimately serve them or our country.

To the best of my knowledge there does not exist an Internet voting system that guarantees voter privacy, allows only eligible voters to vote, or provides the transparency to double-check the announced outcome of an election.
