COLORADO SECRETARY OF STATE RULEMAKING HEARING

5/24/2022

SUPPLEMENTAL COMMENTS OF JOHN CASE 5/31/2022

John Case supplements his comments at the Rulemaking Hearing 5/24/2022 with electronic copies and references to the following Exhibits:

Exhibit 1 – Report of Doug Gould 9/15/2021

Exhibit 2 - Report of Doug Gould 2/28/2022

Exhibit 3 - Report of Doug Gould 3/11/2022

Exhibit 4 - Comments of Doug Gould 5/23/2022

Exhibit 5 – Report of Jeff O'Donnell and Walter Daugherty 3/19/2022

Exhibit 6 – Comments of Jeff O'Donnell 5/23/2022

Exhibit 7 – Comments of Merlin Klotz 5/23/2022

Exhibit 8 – Comments of Jeff Young 5/23/2022

Exhibit 9 – Resume of Ed Arnos

Exhibit 10 – Objections of Ed Arnos 5/22/2022

Exhibit 11 – Another Approach by Ed Arnos 5/24/2022

Exhibit 12 – Comments of Maurice Emmer 5/19/2022

Exhibit 13 – Affidavit of Dallas Schroeder with Attachments A-D

Exhibit 14 – Comments of Shawn Smith 5/24/2022

Exhibit 15 – 2000 Mules Documentary (DVD hand delivered to SOS)

Exhibit 16 – DOJ Publication 7/28/2021

Exhibit 17 – Forensic Image of Elbert County Voting System 8/26/2021 (Two external hard drives containing forensic image are in custody of Colorado Secretary of State with duty to preserve and protect per court order in case no. 2022CV0016, District Court of Elbert County

EXECUTIVE SUMMARY

This report documents initial findings in an ongoing forensic examination of the voting systems of Mesa County, Colorado, used in the November, 2020 General Election. These voting systems represent a portion of overall election systems infrastructure, and this report is limited to the findings of an ongoing investigation. The findings in this report were prepared by the cyber forensic expert retained to advise the County Clerk pursuant to her duties as the county's Chief Election Official as part of the impacted parties' legal team.

Federal law requires the preservation of election records – which includes records in electronic or digital form – for twenty-two months after an election. Colorado law requires the preservation of election records for an additional three months beyond the Federal requirement. The obligation to ensure the integrity of elections and that all election records are preserved pursuant to federal and state law falls to the elected Clerk & Recorder. This report, the first of several, is based on examination of the data obtained from forensic images of the Dominion Voting System EMS server last used in Mesa County for the November, 2020, election, images taken in furtherance of the preservation requirements of federal and state law. Based upon information received by the Clerk's office from various sources in early 2021, the Clerk became concerned that the voting system modifications might jeopardize these preservation and other legal requirements under the responsibility of the County Clerk. For this reason the Clerk ensured a full backup of election records from the County voting systems, both before and after the software modification performed by the vendor and the Secretary of State on May 25-26, 2021, just six months after the November, 2020, election.

Forensic examination[1] found that election records, including data described in the Federal Election Commission's 2002 Voting System Standards (VSS) mandated by Colorado law as certification requirements for Colorado voting systems, have been destroyed on Mesa County's voting system, by the system vendor and the Colorado Secretary of State's office. Because similar system modifications were reportedly performed upon county election servers across the state, it is possible, if not likely, that such data destruction in violation of state and federal law has occurred in numerous other counties.

The extent and manner of destruction of the data comprising these election records is consequential, precluding the possibility of any comprehensive forensic audit of the conduct of any involved election. This documented destruction also undermines the conclusion that these Colorado voting systems and accompanying vendor and Colorado Secretary of State-issued procedures could meet the requirements of Colorado and Federal law, and consequently vitiates the premise of the Colorado Secretary of State certification of these systems for use in Colorado.

Two backup images, using forensic imaging methods, were obtained from the Dominion Voting Systems (DVS) Democracy Suite (D-Suite) Election Management System (EMS) Standard Server in Mesa County, Colorado. The first image was made of that EMS Standard Server in the D-Suite 5.11-CO version configuration, as used in the November, 2020 election. The second image was of the configuration of the EMS Standard Server in the D-Suite 5.13 version configuration, following the modification of the EMS Standard Server by a combined team of DVS vendor personnel and Colorado Secretary of State staff. The forensic information provided in this report is presented using screenshots from forensic analysts' systems running industry-standard forensics software tools. The report includes "before" and "after" screenshots from the forensic tool that shows the differences between the two backup images.

The forensic examination found that numerous logfiles had been deleted or overwritten. These logfiles are required to reconstruct the function of and events taking place on the the voting systems, and based upon information

---

[1] Many individuals and organizations, some public officials, have made recent claims that no audit performed nor examination conducted on elections or computer-based election systems can be legitimate or credible unless the examiners are "election experts" or accredited election auditors. There is no such thing as an "accredited election auditor," nor are there Federal standards or procedures to credential election auditors.

provided by legal counsel, must, by law, be preserved. By comparing filenames in the two images (before and after the Dominion update on May 25-26, 2021), examination and analysis identified a total of 28,989 files that were deleted. During a software update, some replacement of program files and their related content is normally expected. However the examination found that 695 log and event log files necessary for the determination of election integrity were deleted.

Based upon information provided by legal counsel, Colorado law (Colorado Revised Statute (CRS) § 1-5-601.5) requires that, prior to use in Colorado elections, electronic and computer-based voting systems be certified by the Colorado Secretary of State. This certification is based on the systems' compliance with the requirements of the Federal Electon Commission's 2002 Voting System Standards (VSS), verified by their testing by a Federally-accredited (by vote of the U.S. Election Assistance Commission (EAC)) Voting System Testing Lab (VSTL). While several iterations of newer Voluntary Voting System Guidelines (VVSG) have been issued by the EAC, Colorado's statutory requirement is for compliance with 2002 VSS, which states:

> "Election audit trails provide the supporting documentation for verifying the accuracy of reported election results. They present a concrete, indestructible archival record of all system activity related to the vote tally, and are essential for public confidence in the accuracy of the tally, for recounts, and for evidence in the event of criminal or civil litigation."

The relevant sections of the VSS are cited in Appendix E.

These statutory requirements establish that voting systems are required to generate and preserve, as critical to the ability to determine and reproduce the conditions and details of election conduct using these systems, logfiles of all system functions, including normal activity, connectivity, file and data access, operator- and automated-processes, and errors. Logfiles are critical to the ability to detect improper operation, including the ability to detect malicious intrusions as well as other improper activities and conditions, and configuration changes that could enable alteration of the actual vote count.

Assuming this information to be correct, this forensic examination found that a substantially large number of these requirements have not been met. This examination also found that destruction of critical logfiles has occurred. This destruction is not incidental or minor but is extensive.

The purpose of this initial report is to document these findings and present preliminary evidence demonstrating unacceptable conduct and system defects revealed by the examined images, as necessary for the Chief Election Official to discharge her statutory obligations. The facts and resultant findings support the conclusions that:

1) Election-related data explicitly required to be preserved, as stated in the 2002 VSS criteria referenced in this section, have been destroyed in violation of Federal and State law, and

2) Due to non-compliance with the 2002 VSS requirements, these voting systems and accompanying vendor-provided, Colorado Secretary of state-approved procedures cannot meet the certification requirements of the State of Colorado, and should not have been certified for use in the state.

Comprehensive investigation is required to determine whether these critical failures are the result of malicious intent or negligence, and to what extent the systems may have been compromised or subjected to unauthorized access or operation prior to, during, and after election use. That comprehensive investigation *is beyond the scope of this report*. Subsequent reports will address these issues in detail.

Evidence supporting all of these findings is documented in this report.

Introduction

Election officials, including Secretaries of State, are obligated by law to ensure the integrity of all elections, including the transparency required for citizens to verify that integrity themselves. Modern electronic voting systems are marketed as an efficient solution to streamline the voting process and allow for automated collection, tabulation, and reporting of election results, but the efficiency they promise comes at a cost.

The necessary measures and safeguards to ensure the integrity of the systems and their operation against a severe, mounting and ever-evolving threat from sophisticated nation-state and non-nation-state actors are so complex and dynamic as to outpace the limited capabilities and resources of our government, at all levels. While minimal security safeguards may be within government capacity, modern computer-based voting systems are extremely complex and difficult to secure, even for cybersecurity experts, and since voting systems are not under the direct control of the Federal government's top security experts, any government assurances about the sufficiency of those safeguards can serve only to mislead citizens and policy-makers. Even critical defense systems, relentlessly monitored and defended by highly-trained teams using costly, sophisticated tools, are at risk and are frequently compromised, sometimes before procurement. Earlier generations of voting systems relied on simple, human-scale safeguards, for example "air gaps"— that is – to have no wired network connection to the system. But miniaturized wireless communication technologies and networks have proliferated, with billions of wireless devices installed or in use, and malicious actors have developed sophisticated attacks to bypass air gaps, compromise every kind of hardware, firmware, and software, often before they even come into customer or user possession, and to move laterally through networked systems, often undetected. Supply-chains for these systems, from the initiation of the design of integrated circuits and electronic components, most manufactured overseas with little U.S. insight or oversight, through the fabrication, testing, assembly, integration, and operation of these complex composite systems, are vulnerable and untrustworthy for critical functions of government and lucrative economic and national security targets. For all these reasons logfiles, such as those that have been deleted by the Dominion "Trusted Build" update must be preserved to document the complete operation of the computer system and voting applications, and to be able to verify the authenticity, integrity and accuracy of the vote.

The feature size of individual circuits in the chipsets and components of our voting system computers is at the nanoscale, smaller than the smallest known virus particle, and less than 3/10,000ths of the width of a human hair. So we have lost the ability, if we ever had it, to visually verify what is really happening, even at the physical level, in our computer-based voting system. Regardless of how the systems appear to be configured to authorized users and poll-watchers, the functionality and connectivity in these computers can be enabled and modified remotely and wirelessly, or by the introduction of embedded codes on scanned paper, or triggered by specific unforeseeable and indiscernible predetermined software and hardware conditions, or by specific timing events, or by geographic location, or by the proximity of other devices or combinations of any of these means.

For example, some Colorado voting systems ordered as specified by the voting system vendors, from foreign manufacturing and assembly facilities, have included "Integrated Dell Remote Access Controllers (IDRAC)," which are designed to allow "out-of-band" remote management of those systems, meaning that the computers are explicitly equipped to be controlled by remote automated programs or by individuals other than those logged in locally. Through the IDRAC, voting systems might have any aspect of their Basic Input/Output System (BIOS), operating system, or applications controlled or modified, including the addition and deletion of user accounts, the enabling of communications components like wireless networking cards, and the modification, installation, removal or configuration of software and settings. Like the inclusion of multi-band wireless networking cards, similarly specified and ordered for Colorado voting systems by the vendor, there is no excuse or rational justification for the inclusion of components like these, and the fact that the entirety of U.S. voting system regulatory processes and institutions can apparently neither detect, note, nor address these gross vulnerabilities eviscerates the notion that our computer-based voting systems have been secured.

Faced with incredible miniaturization, the importance of logfiles which are records of operation of a computer system, are more important than ever in managing this technology. When the computer is part of a national critical infrastructure, these operational records become essential, not only for troubleshooting or security alone, but for the integrity of the system itself as a component of the National Critical Infrastructure.

For the purposes of this document and ensuing discussion, two terms are defined to differentiate and clarify the evidentiary findings. *Election Data* is all information regarding Ballot Design, Ballot Marking, Electronic scanning of completed ballots, interpretation of the intention of each voter's choice, including human, machine generated or programatic adjudication in the event that the election system is unable to determine conclusively the correct vote input from any specific ballot, tabulation of the actual vote including the databases used to actually contain the raw vote totals, scanned ballot images and Voter Registration and Voter identification information associated with any specific election, as well as the actual vote totals. This includes a complete record of any realtime changes in databases resident in the cloud such as voter registration data. *Election-Related Data* includes all of the computer log and configuration data that document the complete configuration state and operation of the entire computer system and infrastructure upon which Election Software is executed, as well as the operating system of devices that store log and election data such as Network Attached Storage (NAS). Also included in Election-Related data are logs and configuration of network Routers, Firewalls, Intrusion Detection Systems, Intrusion Prevention Systems, and other network security devices, including VPNs and more[2].

Both Election Data AND Election-Related Data must be preserved as "Election Records" under the law, and this is broadly addressed in both the 2002 VSS and the EAC's successor versions of VVSG.

Securing computer systems is a non-trivial task. It involves a litany of processes, including, but not limited to:

- Engineering systems with a focus on security

- Building systems to meet published high-security standards and applicable regulations

- Patching systems to ensure that vulnerabilities are removed

- Securing networks to ensure highly controlled access

- Logging of all communications, processes, access, system modifications

- Auditing of systems and logs regularly to ensure ongoing compliance

- Adequate training and certification for engineers, administrators, and system users

- Adherence to Industry Best Practices, for example, emphasis on password strength and configured security and group policies

These, among other measures, will help to ensure what is known as the CIA triad. The CIA triad represents the three pillars of information security: confidentiality, integrity, and availability, as follows:

---

[2] Log and configuration examination of not only the computer system(s) but also all network systems are critical to forensic examination. Compromise of any unrelated information (e.g. plain-text cofiguration data containing normally-encrypted passwords) can be easily prevented, so long as simple, quick forensic examiner and cyber professional industry standards are used to obfuscate private and sensitive data from the network device files.

Confidentiality – preserving authorized restrictions on information access and disclosure, including means for protecting personal privacy and proprietary information

Integrity — guarding against improper information modification or destruction and ensuring information non-repudiation and authenticity

Availability – ensuring timely and reliable access to and use of information
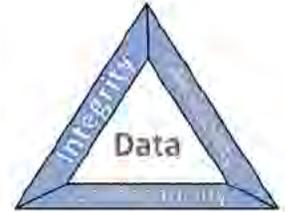

Failure in any of the three pillars can and generally will result in a compromise of the system. Failure in the integrity component can have dire consequences for public perception, election results, the future of our government and our country.

Industry-standard forensics analysis tools were applied to the forensic examination.

Information was forensically evaluated using backup images taken from a Mesa County Election server configured for DVS D-Suite 5.11-CO on Sunday, May 23, 2021, before its modification by Dominion Voting Systems and the Colorado Secretary of State to DVS D-Suite 5.13, and again on Wednesday, May 26, 2021, after the update had been applied. This server was the primary system that was used to process election data in Mesa County for the 2020 general election.The EMS server configuration and administrative standards were prepared by Dominion Voting Systems (DVS), running a combination of COTS and proprietary DVS software, and certified for use by the Colorado Secretary of State. Our conclusions include determining that this system not only failed to meet any reasonable standard or statutory requirement for cybersecurity but was also subject to removal of critical information (data destruction).

Our findings include serious irregularities that resulted in the loss of data integrity on the server, including election data and election-related data.

LEGAL REFERENCES

Several Federal and Colorado state legal standards apply to the preservation and definition of election records, applicable to the data generated by and resident on voting systems. Beginning with 52 USC §20701, retention and preservation of records and papers by officers of elections; deposit with custodian; penalty for violation, which states:

> Every officer of election shall retain and preserve, for a period of twenty-two months from the date of any general, special, or primary election of which candidates for the office of President, Vice President, presidential elector, Member of the Senate, Member of the House of Representatives, or Resident Commissioner from the Commonwealth of Puerto Rico are voted for, all records and papers which come into his possession relating to any application, registration, payment of poll tax, or other act requisite to voting in such election, except that, when required by law, such records and papers may be delivered to another officer of election and except that, if a State or the Commonwealth of Puerto Rico designates a custodian to retain and preserve these records and papers at a specified place, then such records and papers may be deposited with such custodian, and the duty to retain and preserve any record or paper so deposited shall devolve upon such custodian. Any officer of election or custodian who willfully fails to comply with this section shall be fined not more than $1,000 or imprisoned not more than one year, or both.

In addition to 52 USC §20701, multiple sections of Colorado Revised Statutes (CRS) appear applicable, including:

CRS 1-5-601.5. Compliance with federal requirements (Effective until July 1, 2022)

All voting systems and voting equipment offered for sale on or after May 28, 2004, shall meet the voting systems standards that were promulgated in 2002 by the federal election commission. At his or her discretion, the secretary of state may require by rule that voting systems and voting equipment satisfy voting systems standards promulgated after January 1, 2008, by the federal election assistance commission as long

as such standards meet or exceed those promulgated in 2002 by the federal election commission. Subject to section 1-5-608.2, nothing in this section shall be construed to require any political subdivision to replace a voting system that is in use prior to May 28, 2004.

CRS 1-7-802. Preservation of election records

The designated election official shall be responsible for the preservation of any election records for a period of at least twenty-five months after the election or until time has expired for which the record would be needed in any contest proceedings, whichever is later. Unused ballots may be destroyed after the time for a challenge to the election has passed. If a federal candidate was on the ballot, the voted ballots and any other required election materials shall be kept for at least twenty-five months after the election.

1-13-716. Destroying, removing, or delaying delivery of election records

(1) No person shall willfully destroy, deface, or alter any ballot or any election records or willfully delay the delivery of any such ballots or election records, or take, carry away, conceal, or remove any ballot, ballot box, or election records from the polling location or drop-off location or from the possession of a person authorized by law to have the custody thereof, or aid, counsel, procure, advise, or assist any person to do any of the aforesaid acts.

(2) No election official who has undertaken to deliver the official ballots and election records to the county clerk and recorder shall neglect or refuse to do so within the time prescribed by law or shall fail to account fully for all official ballots and other records in his charge. Informality in the delivery of the ballots and election records shall not invalidate the vote of any precinct if such records are delivered prior to the canvassing of the votes by the county board of canvassers.

(3) Any person who violates any provision of this section is guilty of a misdemeanor and, upon conviction thereof, shall be punished as provided in section 1-13-111.

And several sections of the Code of Colorado Regulations appear applicable, including:

8 CCR 1505-1, Rule 21, 21.4.2: All voting systems must meet the requirements of the 2002 Voting Systems Standards, parts 5 – 7 of article 5 of title 1, CRS, as amended, and this Rule 21.

FORENSIC EXAMINATION AND ANALYSIS REPORT

FORENSIC ANALYSIS

SYSTEM IDENTIFICATION

The server that was analyzed is capable of operating on a small local area network (LAN). The network consists of several systems, including servers and workstations running in a non-virtualized environment. The server that we evaluated was named EMSSERVER. It is running the Microsoft Windows Server 2016 Standard operating system.

The forensic evaluation and reviews were based upon a forensic image archive collected from the Mesa County Dominion EMS Server. The Before and After forensic images were collected from the same server and same hard drive, as documented below, from the actual acquisition. The serial number of the hard drive shown in each collection data set verifies the data origin to be the same physical device.

Two backup images were obtained, using forensic imaging methods, from the Dominion Voting Systems (DVS) Democracy Suite (D-Suite) Election Management System (EMS) Standard Server in Mesa County, Colorado. The first image was made of that EMS Standard Server in the D-Suite 5.11-CO version configuration, as used in the November, 2020 election on May 23, 2021. The second image was of the configuration of the EMS Standard Server in the D-Suite 5.13 version configuration, following the modification of the EMS Standard Server by a combined team of Dominion Voting System vendor personnel and Colorado Secretary of State (SecState) staff, on May 26, 2021. A forensic image (forensic copy) is a bit-by-bit, sector-by-sector duplicate of a physical storage device using specialized hardware and software; it is a much more comprehensive representation of the state and configuration of the imaged system than could be obtained using simple file backup methods. The images include all files, folders, and unallocated, free, and slack space. These forensic images include not only all the files visible to the server operating system but also deleted files and fragments of files left in the slack and free space but every digital bit of data present on the storage medium, in this case, a SCSI hard disk. When forensic images are acquired, a hash function, also known as a Message Digest, is computed. This hash can be used at any time to validate the integrity of the image to ensure that it has not been edited, modified, or changed in any way. The hash function result from the acquisition of data appears in the text above but also appears inside each respective archive and authenticates the data by demonstrating that it has not changed since it was acquired.

These two images were evaluated to gather technical information, including the integrity of the data stored on the system. No effort was made to reverse-design, de-compile or reverse-engineer the Dominion software. Configuration, which is relevant to the operation of the system, was examined to determine whether improper settings could allow undesirable results and were found to contain such errors. Results relevant to this investigation are documented below. Additional supporting documentation can be found in the appendixes. They include directory listings for many of the directories seen in the screenshots and contain complete filenames, full path names where the files are located, and file hashes.

We have included screenshots that can be used to review and verify these findings. These screenshots were obtained from the forensic images of the Dominion server.

AUTHENTICITY AND CHAIN OF CUSTODY

Digital chain of custody is the record of preservation of digital evidence from collection to presentation in the court of law. This is an essential part of the digital investigation process. The chain of custody is probative that the digital evidence presented to the court remains as originally collected, without tampering. The two images analyzed in this report were obtained through AccessData FTK Imager 4.2.0.13. The serial number on the EMS Server drive on both images match, thus establishing that both images were taken from the same physical drive. I have reviewed the documented chain of custody for both images and have determined that the chain of custody is complete from the forensic operator utilizing FTK Imager through the source from which I directly received these images. (Because of the pending civil litigation and criminal investigation, the written documentation remains in the custody of counsel for later introduction in court proceedings and thus cannot be released as part of this report.) Further confirmation that these are genuine images from the Mesa County EMS Server has been provided by the Colorado Secretary of State's office. See:

https://www.sos.state.co.us/pubs/newsRoom/pressReleases/2021/PR20210817MesaCounty.html

FINDINGS

Overview of System Data Sources

Figure 3 – EMS Server (5.11-CO) System Data Sources Before

Figure 4 - EMS Server (5.13) System Data Sources After
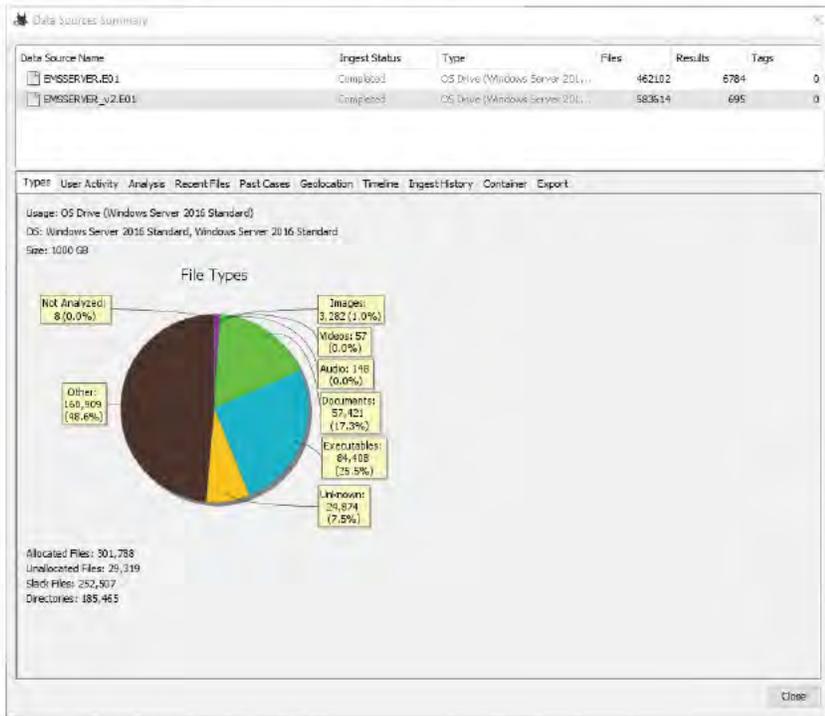

Server Disk Partition Structure Overwritten

Purpose: *The disk partition structure is the structure of how the hard drive is divided up.*

**Figure 5 - EMSSERVER (5.11-CO) Disk Partition Structure Before**

Note Changes in Disk Volumes
and Directory Structures

Figure 6- EMSSERVER (5.13) Disk Partition Structure After

12

Figure 7 - Server Disk Partition and Directory Changes
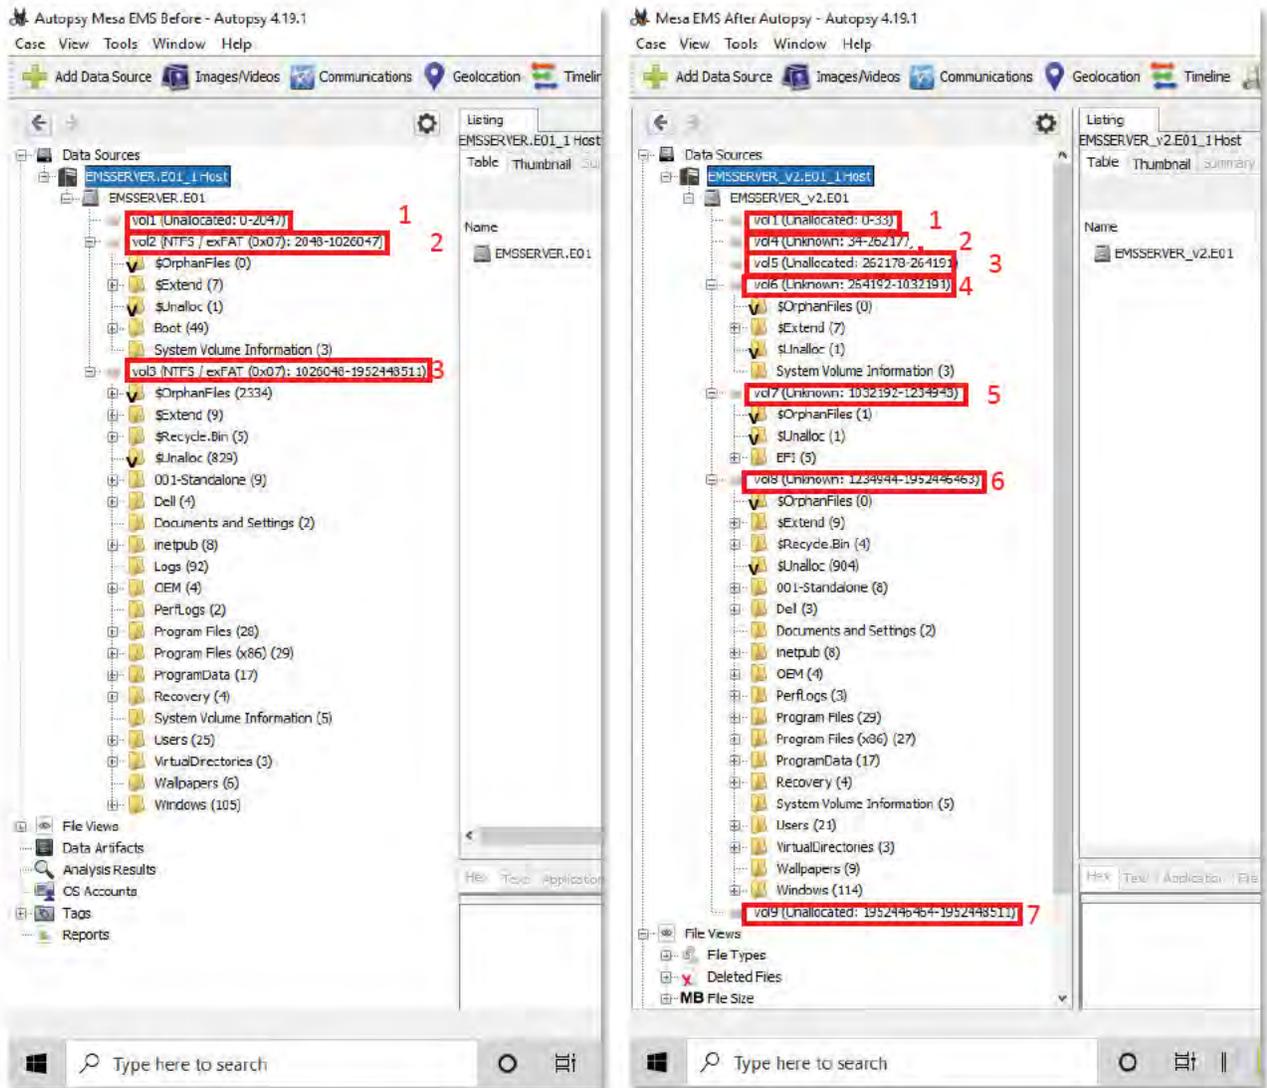

Before Dominion Update   After Dominion Update

Computer hard disk drives are data storage devices that must be prepared before use – specifically, they must be partitioned into logical disk volumes and then formatted. Partitioning a hard disk drive is the equivalent of scoring horizontal and vertical rule lines onto blank paper, and then numbering each line, preparing that paper for the orderly recording and look-up of information. A disk is partitioned to organize information into sets of related data. A partition creates a logical drive, C:, D:, E:, etc., that the Master Boot Record (MBR) or Globally Unique Identifier (GUID) Partition Table, which are like maps of the partitioned and formatted memory storage locations on the hard drive, can then use to write and read stored data.

Creation of such a partition, if previous partitions are not preserved, destroys the "map" of underlying data and data locations when the partition is formatted. The previous partition data is then only recoverable by forensic techniques, and is vulnerable to complete destruction if overwritten by data stored according to the new partition "map." Note that in the before image above, each disk partition (Labeled "volX," e.g. "vol1," for "volume") is identified together with the addresses of the beginning block and ending block for each volume.

By comparing the images, it is evident that the disk was re-partitioned, reformatted, and the previous data map completely destroyed by overwriting it with new data, rendering the prior data (mostly) unrecoverable.

Forensic examination of the system can reveal remnants of deleted data. When a computer deletes a file, it does not erase the data; it merely changes the first character of the filename to a non-printable character recognized by software that accesses the disk. This first character tells the operating system to no longer display the file as it is marked as a deleted file, and the space occupied by the disk is marked as reusable.

Each block on the disk is the smallest unit of disk space that can be used. The size of all blocks on the disk are determined when the disk is formatted. The smallest disk block size in common use is 512 bytes. Even if a file only occupies 50 bytes of disk space, the entire 512 byte block is marked as "in use".

If a file of 500 bytes is written to the disk, it occupies one block of disk space, with the last 12 bytes (on a newly formatted disk) each containing the numeric value zero (0). If this file is then deleted, and a file of 50 bytes is written to the same disk block, the first 50 bytes of the block contain the new file, and the next remaining 450 bytes of the disk block contain the data from the deleted file that previously occupied the disk block (followed by the 12 null (0) bytes of data). This data remnant is referred to as "File Slack Space" and is defined as any previous remnant data that remains on the disk and is not accessible via the operating system nor allocated as an accessible file.

Special forensic software is required to access file slack space, and the data it contains are partial remnants of previous system data. This data may be of use in forensic investigation, and forensic tools often identify it. File Slack is identified here for clarity and better understanding of these data.

Website Server Log Files Missing

Figure 8 - EMS Server (5.11-CO) Web Server Log Files Before
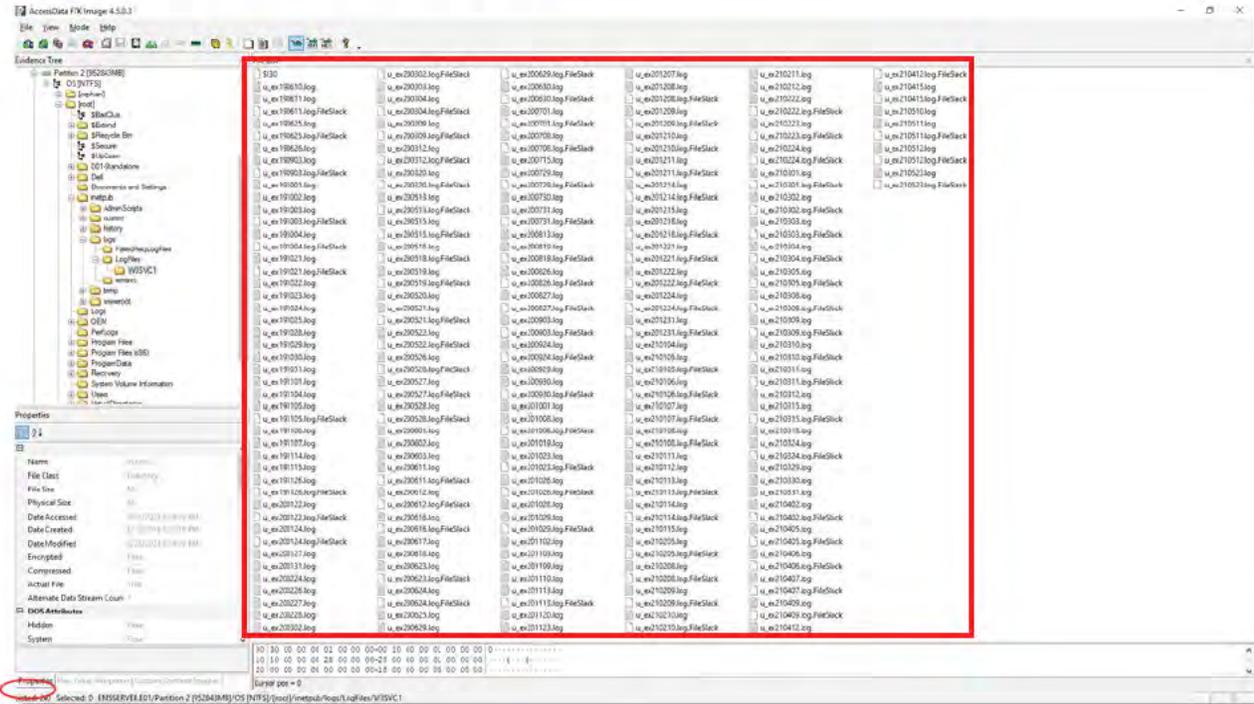

Figure 9 - EMS Server (5.13) Web Server Log Files After

Prior to the Dominion update, there were 240 log files in this folder. After the update, there are only 3 log files showing and 3 (partial) remnants of previously used log files in File Slack space.
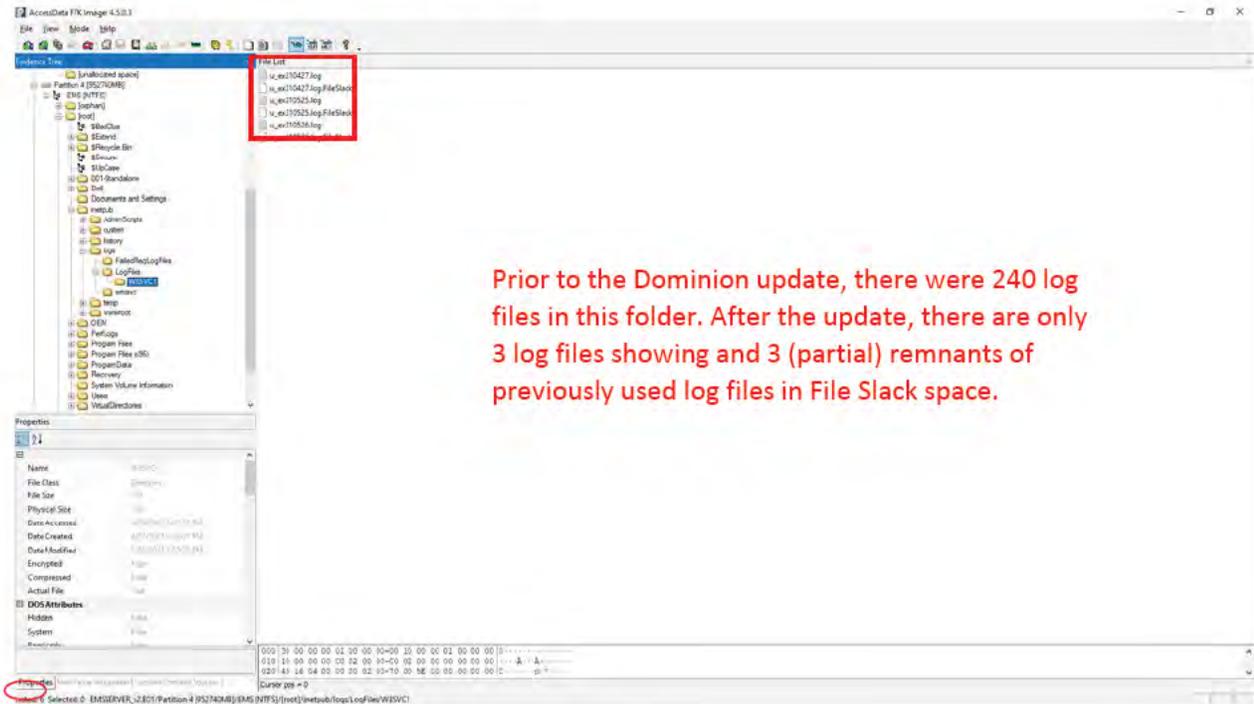

A web server provides information to external web clients (via "web browser" software) using the HyperText Transfer Protocol (HTTP). This information can include both read and write access to databases and static presentation of information.

Some software system designs utilize an Ethernet network interface that is essentially an internal connection to itself, known as a *loopback* interface. Thus the presence of a Web Server, by itself, does not indicate a connection to an external ethernet interface. However, such an external connection may be indicated by the data within web server logs, which are stored by default in Microsoft operating systems with Microsoft Internet Information Services (IIS) installed, in a "logs" subfolder to the "inetpub" folder. That log data would include information regarding what web pages and data were accessed and whether it was accessed from within the server (loopback) or via an external network connection.

In these before and after views of the same web server directories, it is clear that the web server logs have been destroyed by or during the Dominion/CO Secretary of State DVS D-Suite 5.13 modification.

This log data is required to verify that the election system was not accessed by an external, unauthorized device, but due to the specific and unusual installation method for a critical computing system, chosen by Dominion Voting Systems and endorsed by the CO Secretary of State, these critical data files with election-related data have clearly been destroyed on the Mesa County EMS Standard Server.

Server Microsoft SQL Server Installation Log Files Missing

Purpose: *The Database Management System that is used to hold actual ELECTION DATA – votes from each ballot. These log files contain information detailing the installation events of SQL Server.*

Figure 10 - EMS Server (5.11-CO) MS SQL Server Installation Log Files Before
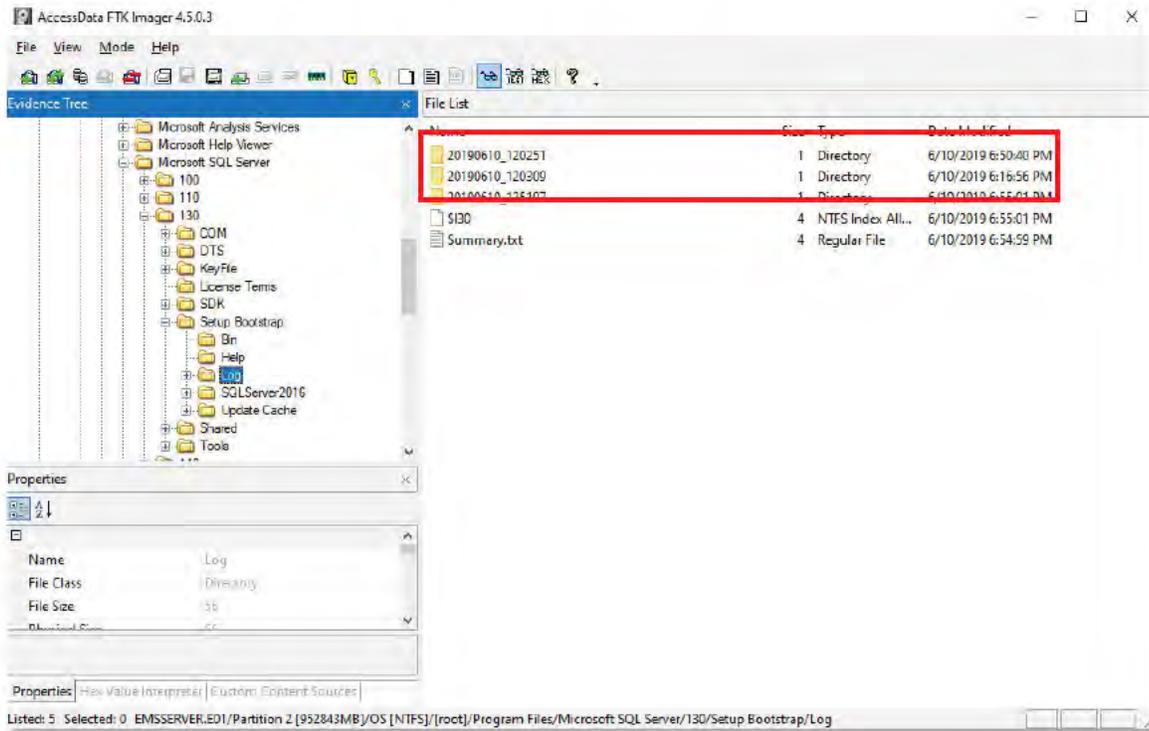

Figure 11 - EMS Server (5.13) MS SQL Server Installation Log Files After

The folders in Before are now completely missing.

17
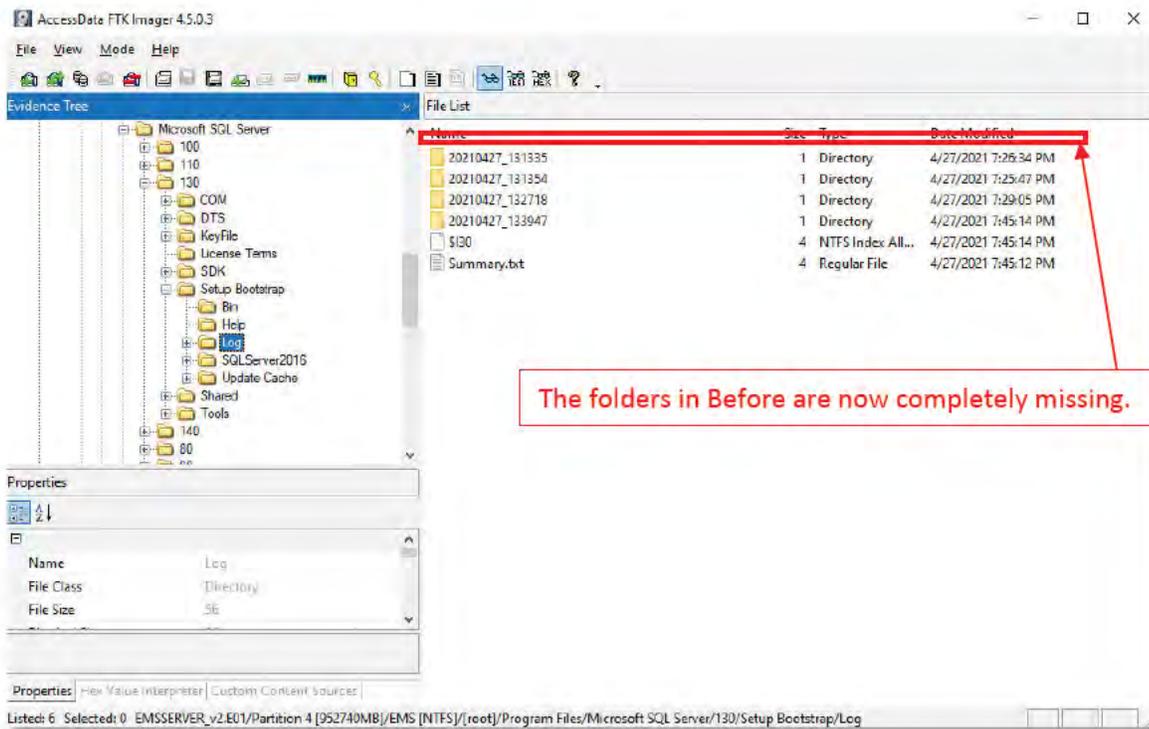

These log files were created by installing the SQL Server Database Management System software and contain data regarding the Initial installation of the software. In a full forensic investigation, these data are part of the information that investigators require to determine a baseline from which can be determined what changes were made, by whom, when the changes were made, and much more on a system with properly configured log recording. Therefore, these data are Election Related as they document not only the configuration but its changes and are relevant to the Integrity of the election.

Figure 12 is an example of log content from the initial software setup. It tells us what (Microsoft) software executes, where data is stored (the G: drive), and it shows us what Registry values have been set during the installation. These are valuable should an investigation of an illegal computer intrusion occur, as they provide a record of the initial configuration during such an investigation.

Figure 12 - Example of Log File Content from EMS Server (5.11-CO) Before
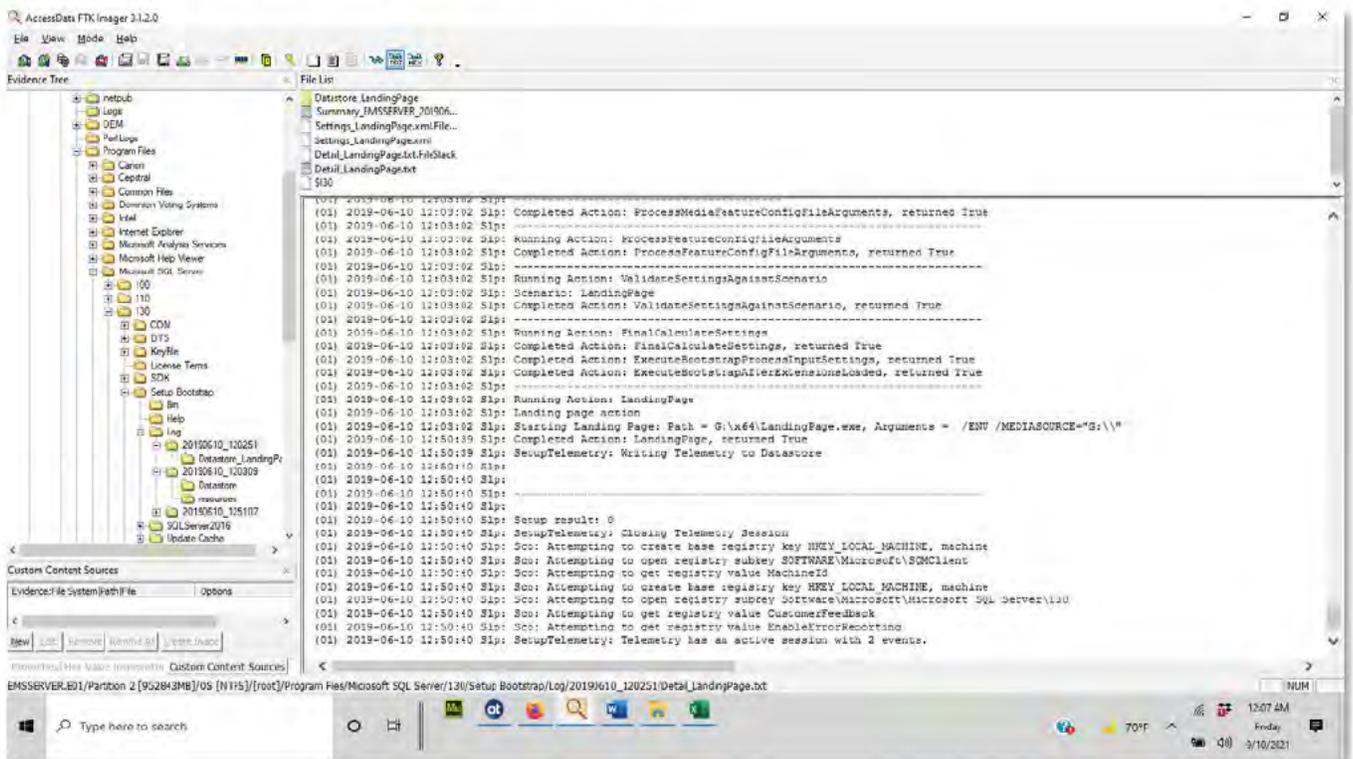

Server Microsoft SQL Server Log Files Missing

Purpose: *These log files keep track of events that occur within the SQL Server that manages the election databases.*

Figure 13 - EMS Server (5.11-CO) SQL Server Log Files Before
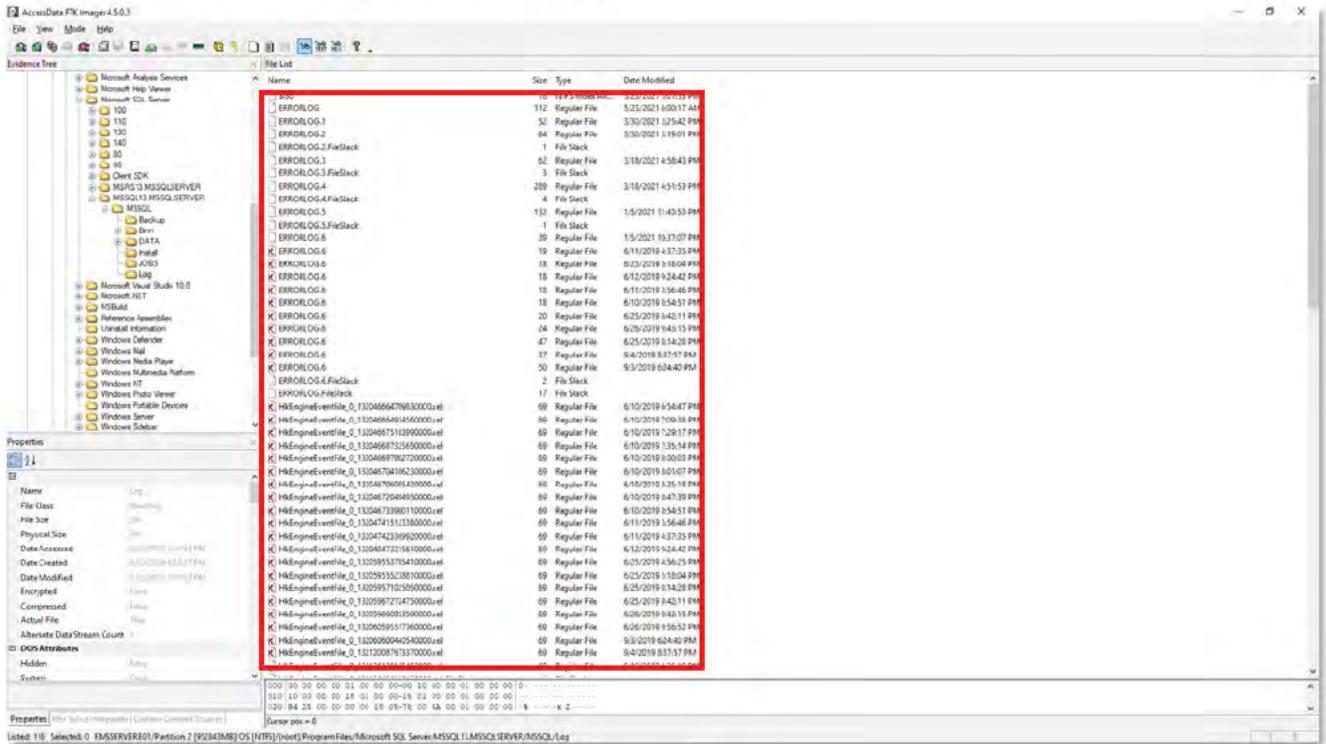

Figure 14 - EMS Server (5.13) SQL Server Log Files After

File sizes are different, file dates are different. Original files have been replaced with new. Previously 116 files, now only 71 files.
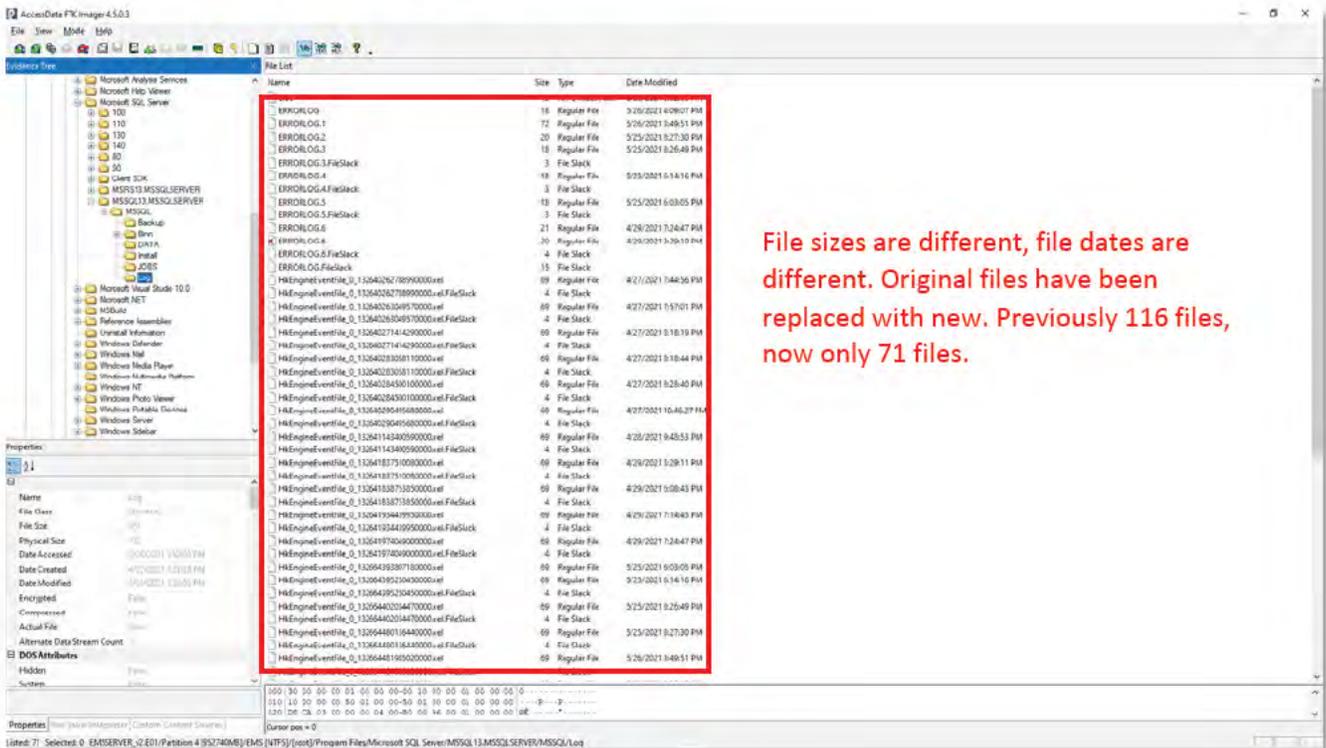

EMS Server Dell Server Updates Missing

Purpose: These log files track installation of updates made to the various components of the servers, including updates to software for a <u>remote-access card</u>.

Figure 15 - EMS Server (5.11-CO) Dell Server Update Files Before
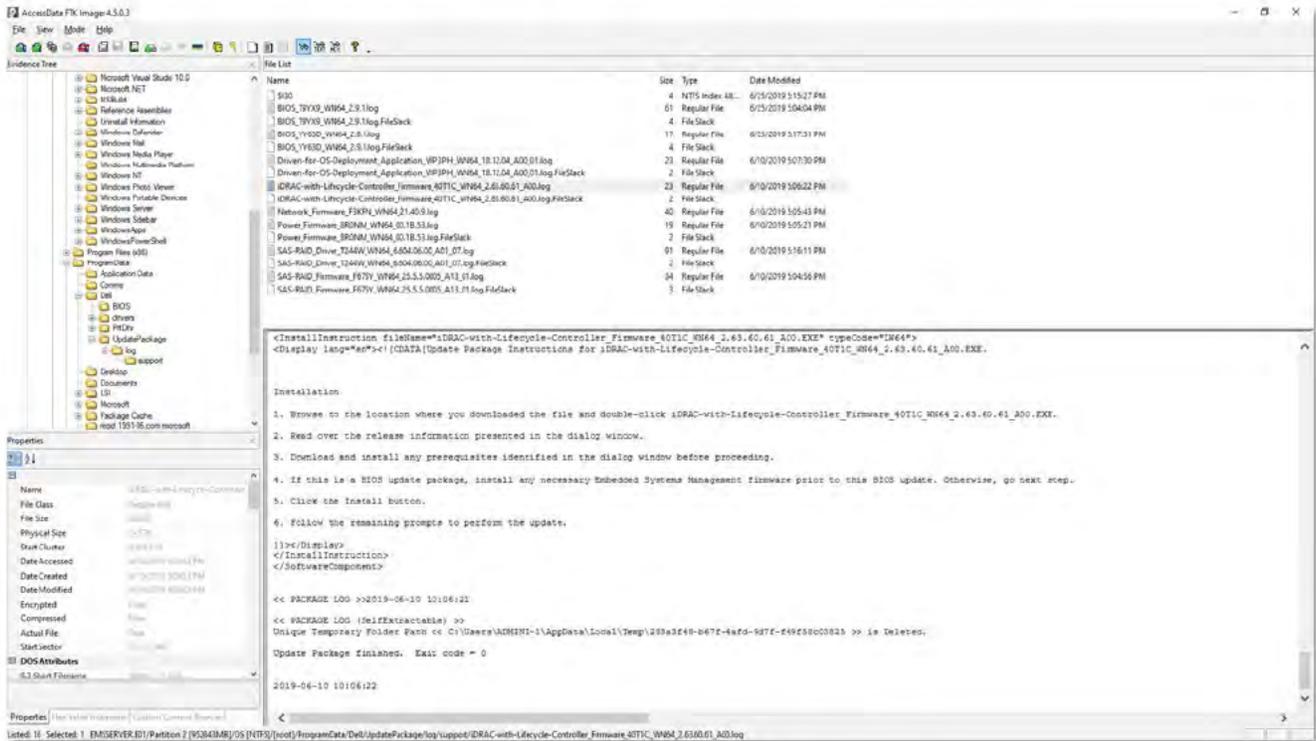

Figure 16 - EMS Server (5.13) Dell Server Update Files After

Sizes, Dates/Times are different. These Log Files have been replaced with <u>different</u> files.
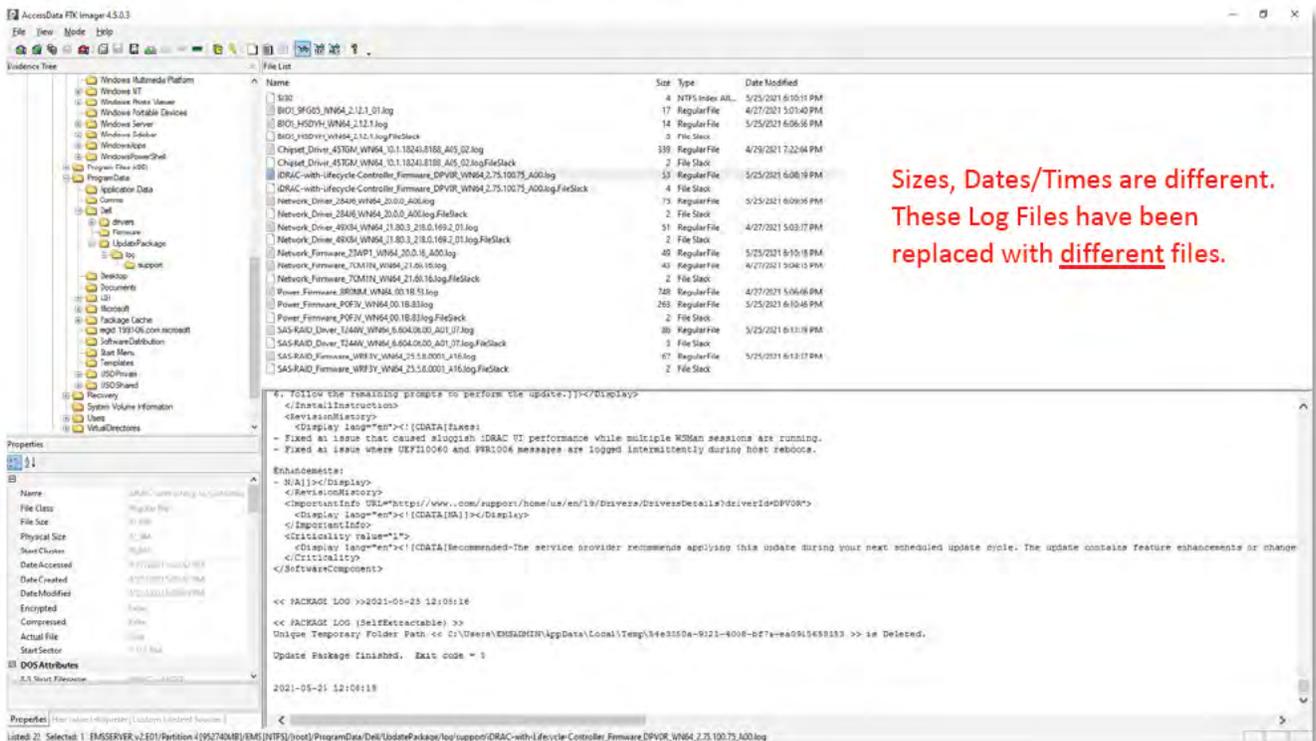

Several log files of great importance to an investigation are shown in Figure 16. The SAS RAID firmware and drivers logs tell us about the functionality of hard disk controllers (RAID is an acronym for Redundant Array of Independent Disks) and about this storage redundancy's physical capability. Network Firmware logs tell us which hardware devices were updated with new firmware, and the version allows us to trace back to its network (and possibly Internet) functionality. The application of iDRAC controller firmware may indicate the presence of a special hardware controller intended to permit complete remote control of the computer system. This iDRAC controller is often used when a data center must be located an inconvenient distance away from its owner and/or operators, or for example, when such a computer might be physically located at an Internet Service Provider's secure data center. The iDRAC controller permits a remote user to remotely turn on the power to the server, reboot it, access administrative control functions, and make changes to the server, *OUTSIDE THE CONTROL, or even the awareness, of the local computer operator and its operating system.* Among the changes possible via an IDRAC are changes to the BIOS (Basic I/O System) including those firmware settings that include the computer Clock, boot device order, which disks or other data storage devices are used to boot the computer, and some other computer capabilities.

Take note of what files remain following the update.

Not only are the files in an entirely different directory, but the file modification dates have changed, and more importantly, these logs are for DIFFERENT versions of the software, and the previous logs have been overwritten.

Physical examination of the EMS computer system is required to verify the presence or absence of an IDRAC controller, however it is highly irregular for update software to install updates to software for a hardware device that has not been installed.

Server 'Administrator' WebCache Log Files Overwritten

Purpose: *These log files store information about websites visited, files opened, etc.*

Figure 17 - EMS Server (5.11-CO) Administrator WebCache Log Files Before
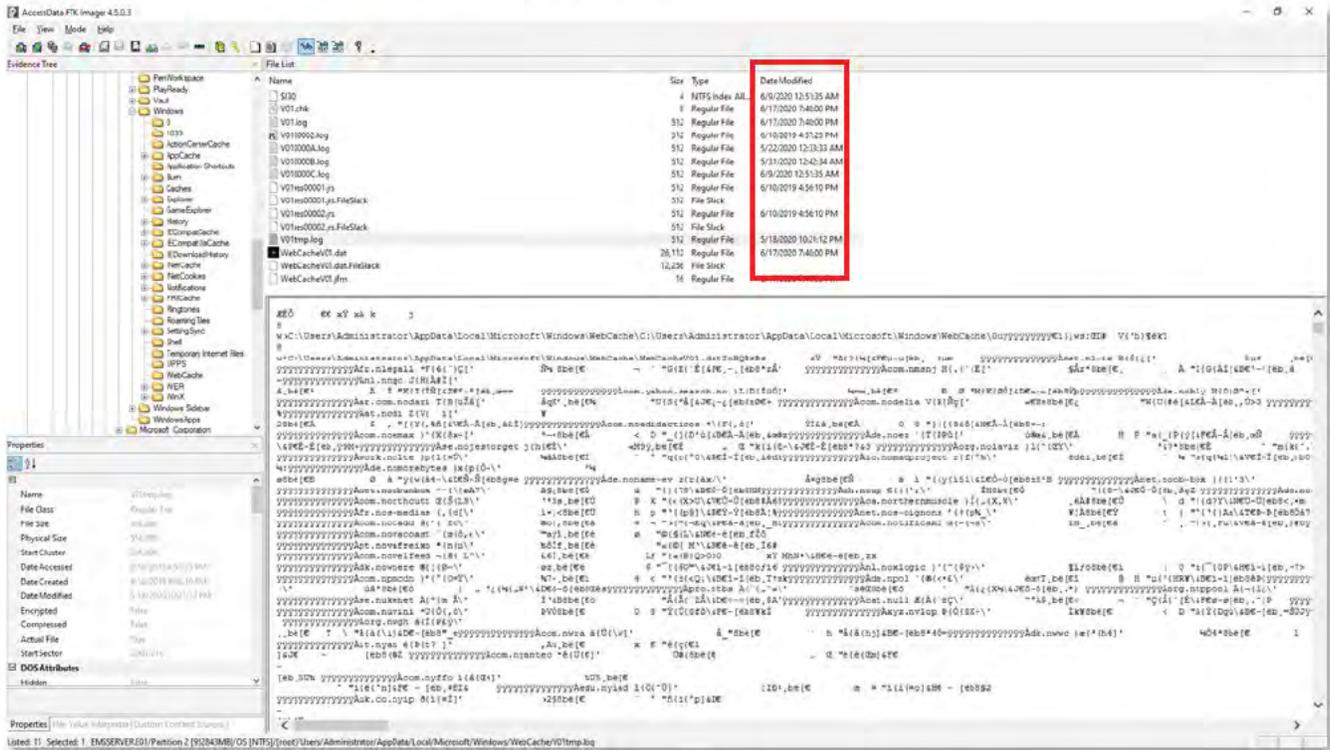

Figure 18 - EMS Server (5.13) Administrator WebCache Log Files After
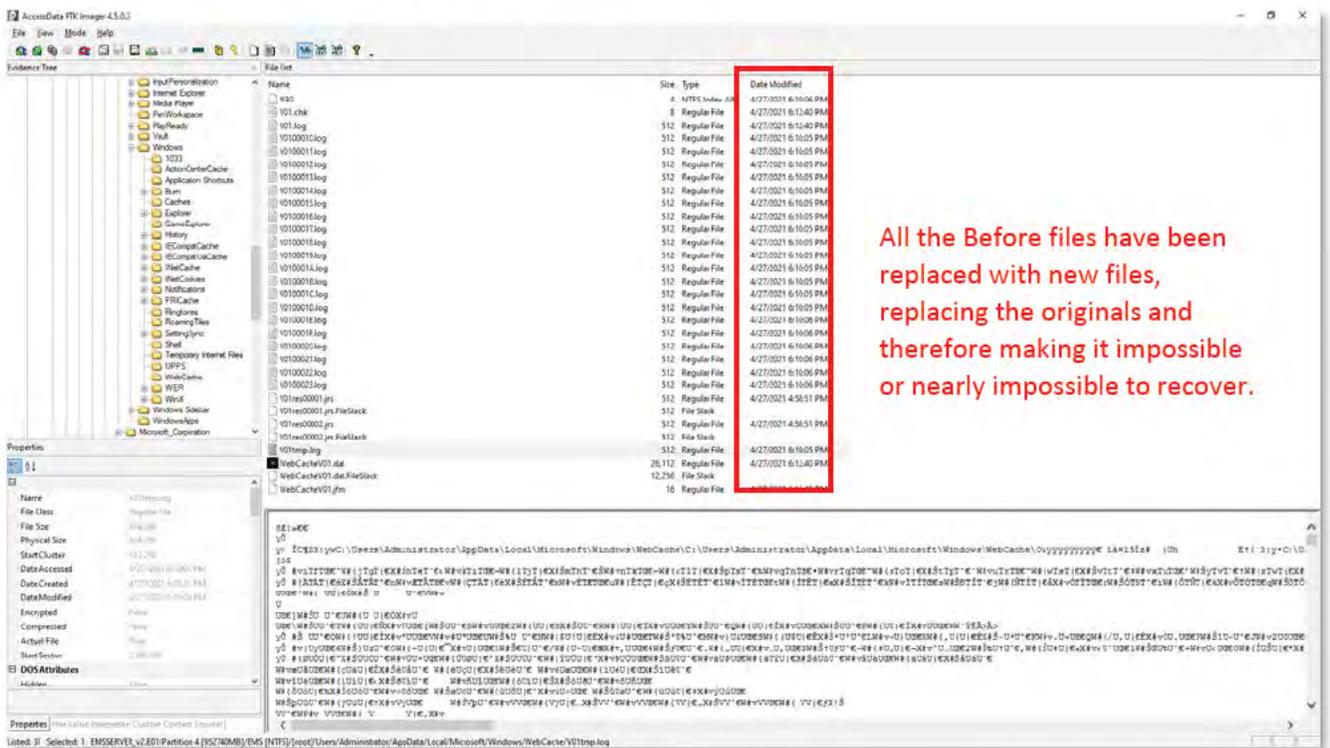

All the Before files have been replaced with new files, replacing the originals and therefore making it impossible or nearly impossible to recover.

Server 'emsadmin' WebCache Log Files Overwritten

Purpose: *These log files store information about websites visited, files opened, etc.*

Figure 19 - EMS Server (5.11-CO) "emsadmin" WebCache Log Files Before

Figure 20 -EMS Server (5.13) "emsadmin" WebCache Log Files After

The WebCache log files have been overwritten. IF the computer has been used on the Internet or with ANY webserver (even one on the local network, including this computer's OWN webserver), these WebCache files indicate the connections that were sought, as well as files that were opened. These may provide *critical* evidence that the system has been connected to a network, including networks that have access to the Internet. THESE ARE NOT the same files in the before and after images. They have been deleted and replaced.

Here is a small subset of some of the information that was found on the Before image in these WebCache log files:

Figure 21 - EMS Server (5.11-CO) Webcache Log File Content Before

Container_15 [Table ID = 49, 25 Columns]

EntryId	ContainerId	Url	AccessedTime
1	15	:2020060820200615: DVSAdministrator@:Host: This PC	132368189382665280
2	15	:2020060820200615: DVSAdministrator@file:///C:/Users/Administrator/Desktop/DVS%20Adjudication%202%20Key.pfx	132368189382821518

For instance, the above log file entry seems to show a DVS Adjudication Encryption Key was accessed, where it was stored and accessed from, and when it was accessed.

Figure 22 - EMS SErver (5.11-CO) Webcache Log File Content Before - II

Container_18 [Table ID = 39, 25 Columns]

EntryId	ContainerId	Url	AccessedTime
1	18	:2021051820210519: emsadmin@file:///F:/Logs	132658341190420467
2	18	:2021051820210519: emsadmin@:Host: This PC	132658341190576330
3	18	:2021051820210519: emsadmin@file:///F:/	132658341190732829
4	18	:2021051820210519: emsadmin@file:///F:/Logs/5_18_21.evtx	132658341410603691
5	18	:2021051820210519: emsadmin@file://emsserver/nas/2020%20Mesa%20County%20General/Results/Tabulator00004/Batch2003/1_1_4_2003_DETAIL.DVD.txt	132658342689478943
6	18	:2021051820210519: emsadmin@:Host: emsserver	132658342689478943
7	18	:2021051820210519: emsadmin@file://emsserver/nas/2020%20Mesa%20County%20General/Results/Tabulator00004/Batch2003/Images/00004_02003_000001.tif	132658342760262058

In addition, the above log file entry seems to show several interesting files (a windows 'evtx' log file being opened from an external attached USB flash drive, and a ballot detail file and even a ballot image from Batch 2003 being opened from a Network Attached Storage device)

Without a forensic Before image prior to a Dominion 'Update', this type of potentially critically-important forensic information could be, and likely would be, lost forever.

Server SQL Server Management Studio (SSMS) Log Files Overwritten

Purpose: These log files track the installation of the SQL Server Management Studio, which is used to get into the back-end of the election databases.

Figure 23 - EMS Server (5.11-CO) SSMS Log Files Before
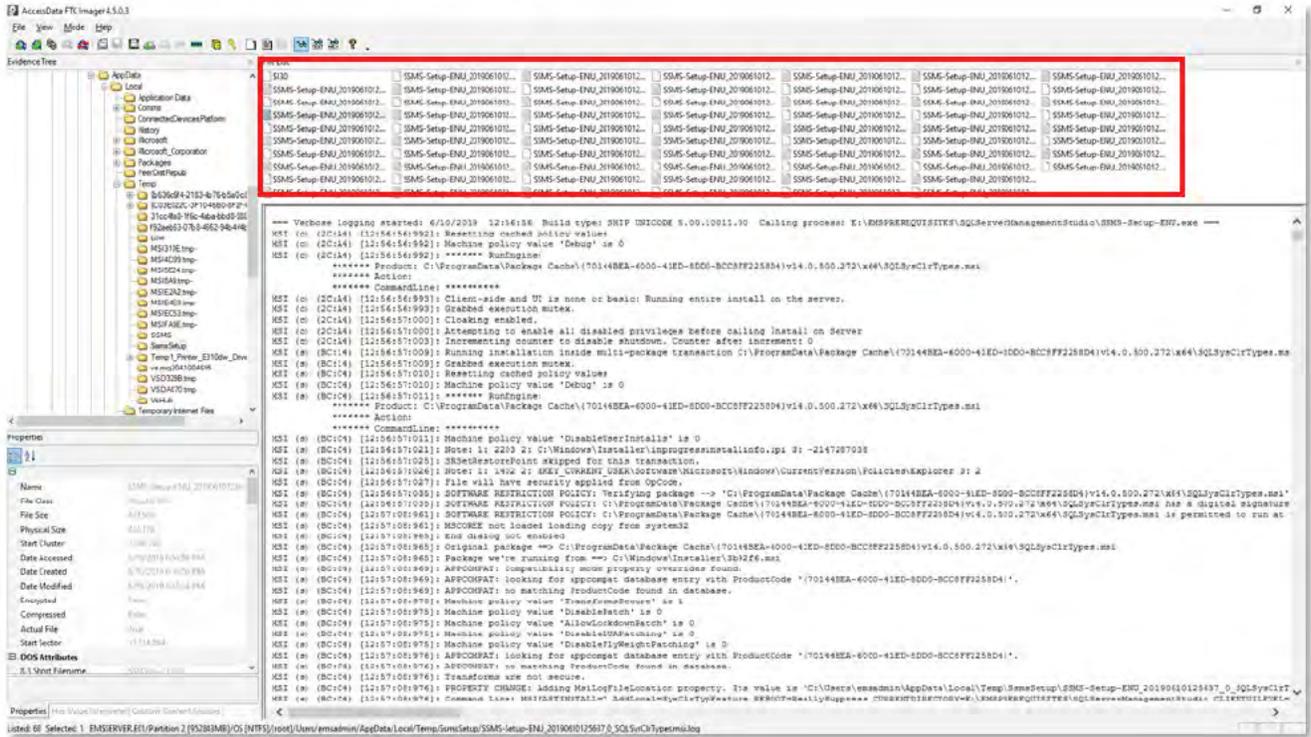

Figure 24 - EMS Server (5.13) SSMS Log Files After

All previous Log Files have been replaced with new files.
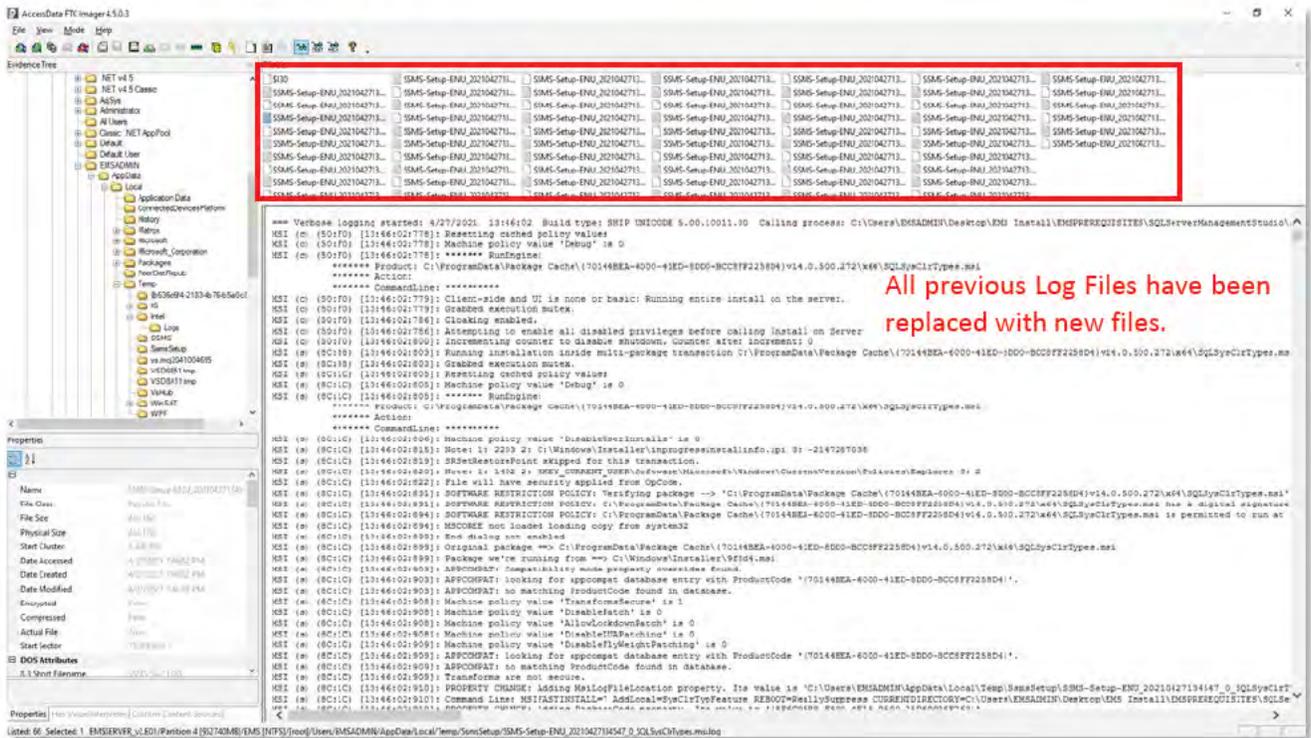

Server CBS Log Files Overwritten

Purpose: *These Log Files contain detailed information about installed updates. They could contain evidence of changes to the server that would cause decertification of the system.*

Figure 25 - EMS Server (5.11-CO) CBS Log Files Before
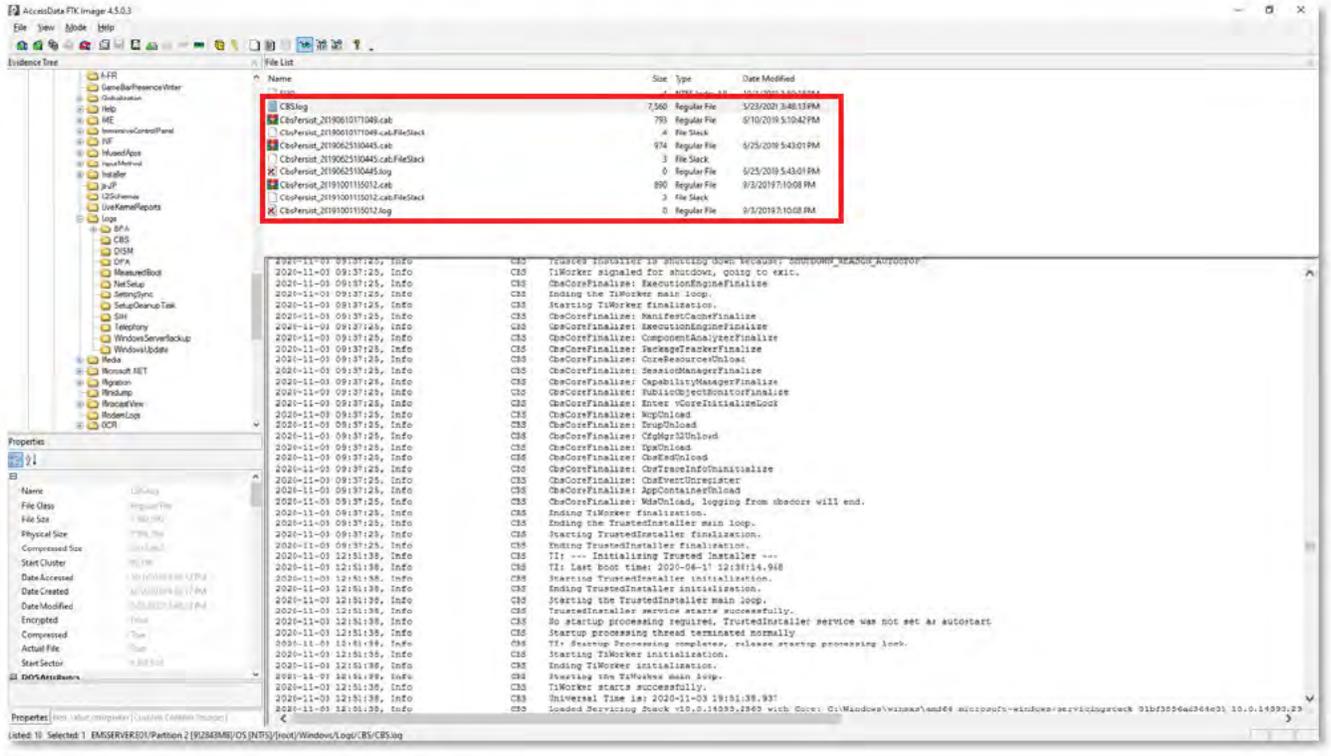

Figure 26 - EMS Server (5.13) CBS Log Files After
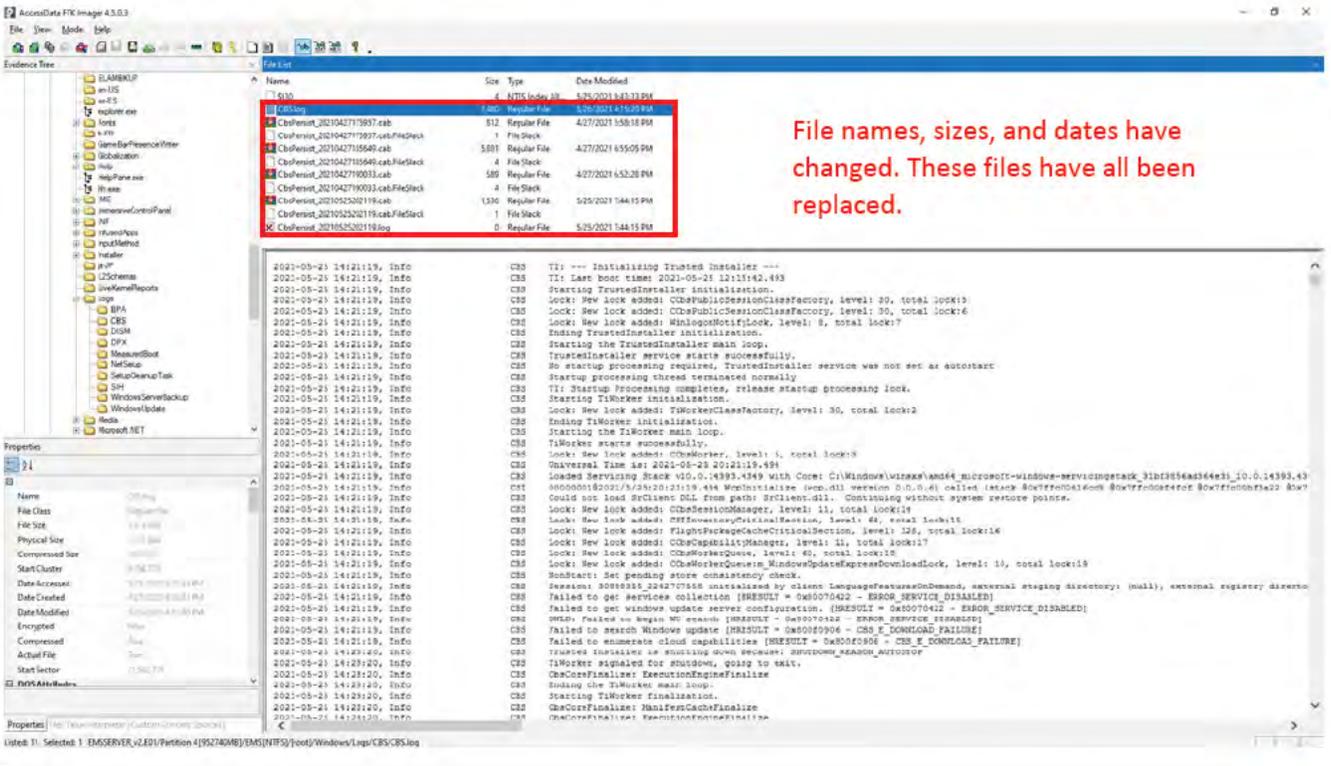

File names, sizes, and dates have changed. These files have all been replaced.

Server Election Databases Missing

Purpose: This folder holds all the databases (votes, information regarding batches, when they were processed, how many were processed, who they were processed by, and much more). There are also multiple extra databases that contain information regarding ballot adjudication.

Figure 27 - EMS Server (5.11-CO) Election Databases Before
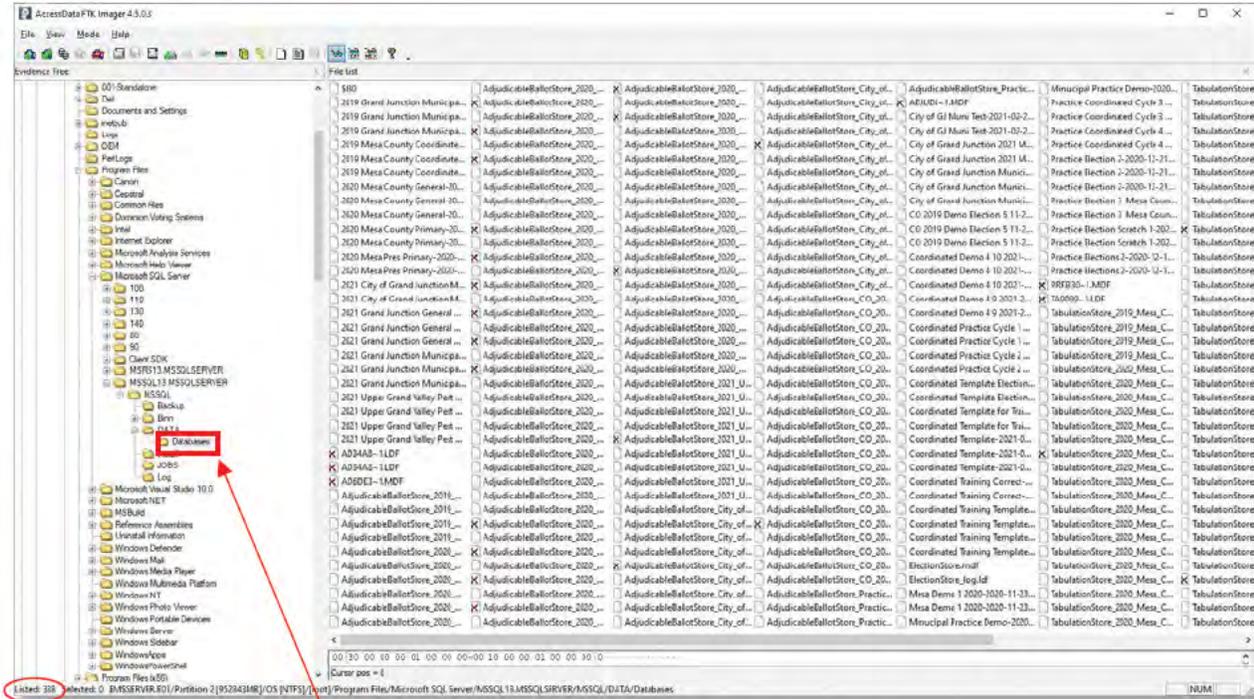

Figure 28 - EMS Server (5.13) Election Databases After

The Entire Database Directory is gone along with all files that were in it.
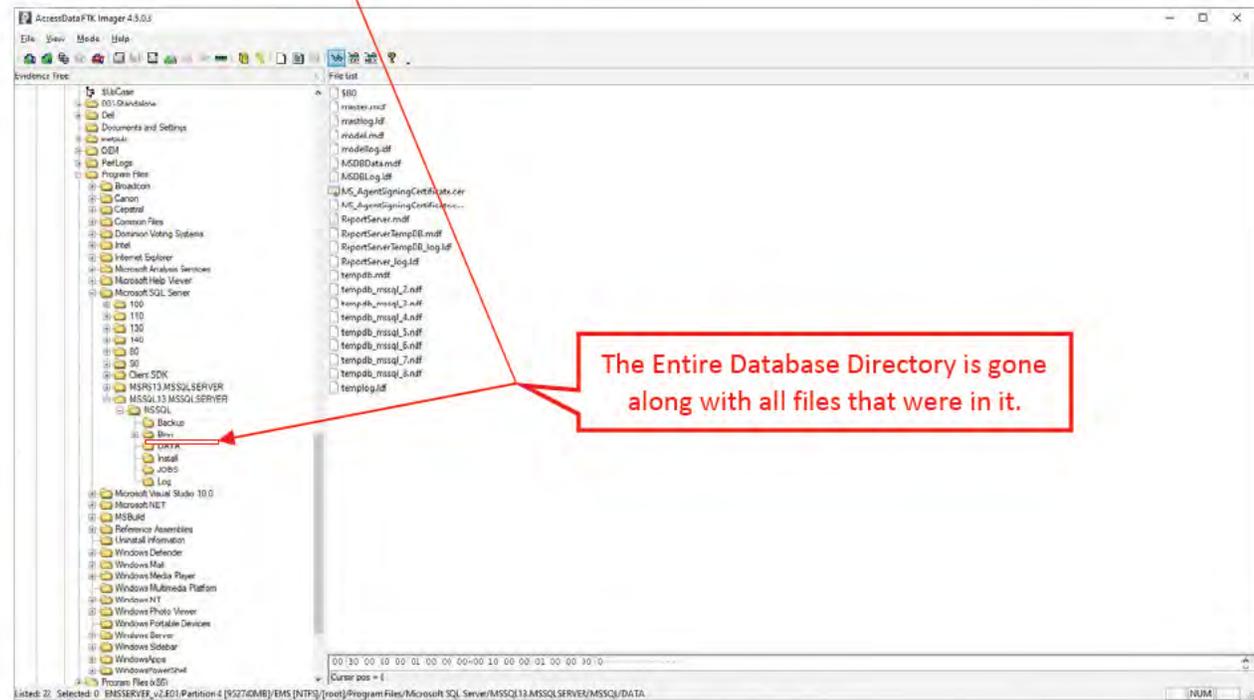

Server DHCP Log Files Missing/Overwritten

Purpose: *DHCP Log Files can show evidence regarding computers or other devices being connected to the network.*

Figure 29 - EMS Server (5.11-CO) DHCP Log Files Before

Figure 30 - EMS Server (5.13) DHCP Log Files After

The Number of Files, Dates, and Sizes are Different. They have all been replaced.

Server Event Logs Missing/Overwritten

Purpose: *These Dominion Log Files keep track of election/project-related activity. The Windows Server event logs outside the red box keep track of much of the activity on the server.*

Figure 31 - EMS Server (5.11-CO) Event Logs Before

Figure 32 - EMS Server (5.13) Event Logs After

Nearly 200 EMS and Adjudication Log Files are gone that should be here alphabetically as they are above. Remaining Windows Log Files have been replaced with new files, retaining no information from Before.

Below are some screen shots of the kind of Election-Related information (such as cast vote records, audit marks, image retrievals, result file loads, etc.) in the EMS Archive Logs that are missing After the Dominion Update:

Figure 33 - Examples of Election Data Missing After Update

Server System Users are Missing

Purpose: These folders store the information for each user account on the server.

Figure 34 - EMS Server (5.11-CO) System Users Before
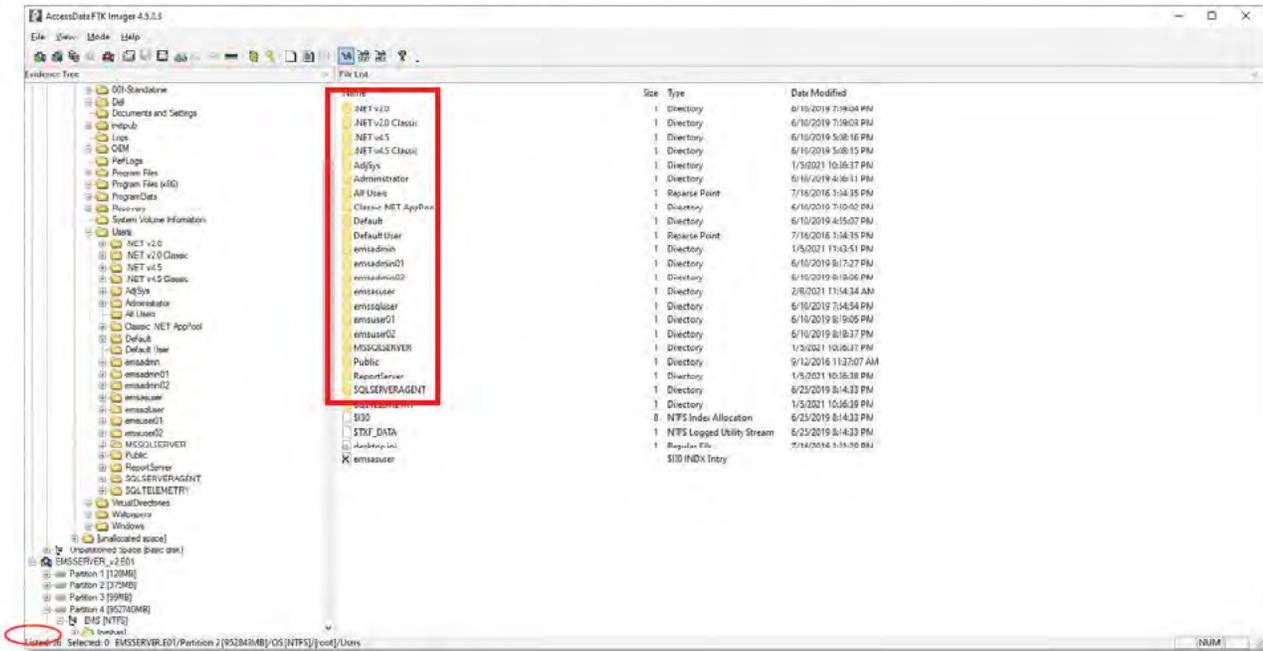

Figure 35 - EMS Server (5.13) System Users After
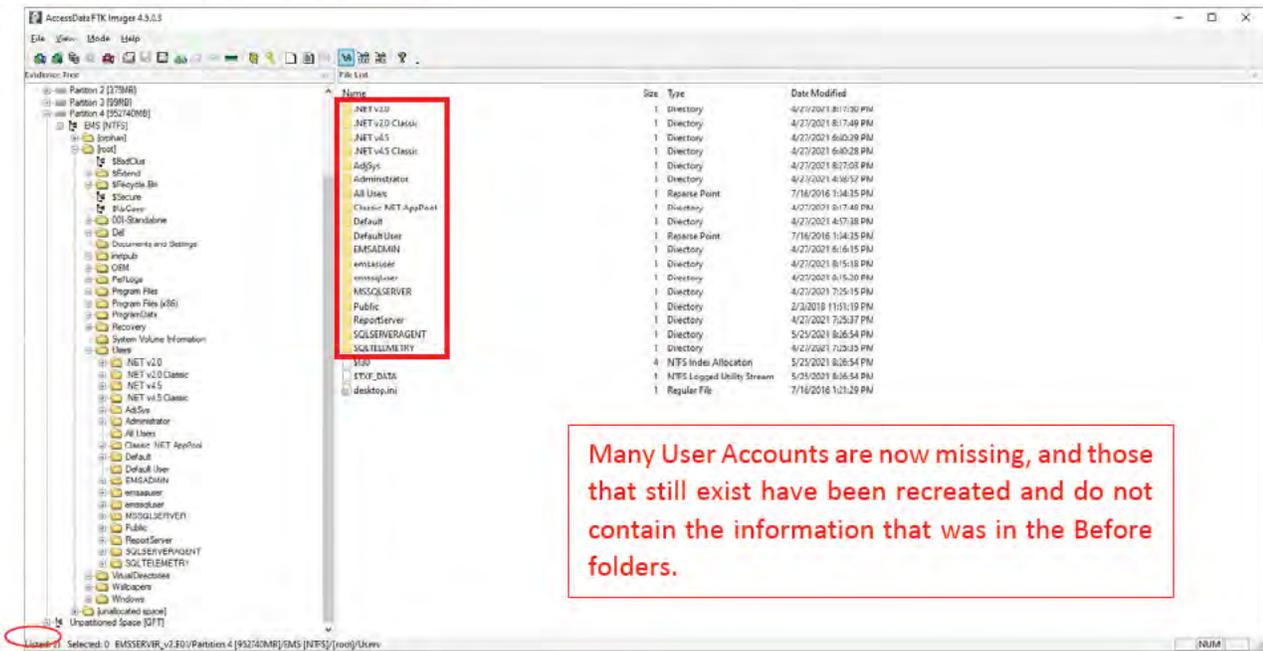

Many User Accounts are now missing, and those that still exist have been recreated and do not contain the information that was in the Before folders.

Server Virtual Directories Log Files Missing

Purpose: These are the Log Files that contain information, warnings, and errors relating to the Website Server as the server processes election projects that have been set up.

Figure 36 - EMS Server (5.11-CO) Virtual Directory Log Files Before

Figure 37 - EMS Server (5.13) Virtual Directory Log Files After

All previous log files are gone.

32

Server Windows Defender Log Files Missing/Overwritten

Purpose: *These log files keep track of the activity of the built-in Anti-Virus software.*

Figure 38 - EMS Server (5.11-CO) Windows Defender Log Files Before Dominion Update:

Figure 39 - EMS Server (5.13) Windows Defender Log Files After

Files and even remnants of previously-deleted Files are missing and replaced with new files.

Server List of .log files in Before Image that were Deleted.

This list that follows this paragraph is a comparison of the Before and After forensic images of the Mesa County EMS Server. It is a comparative list of files that were deleted – either deliberately erased or overwritten with disregard for the preservation of these files, some of which contain ELECTION RELATED data.

Each line in the image below is the full path listing to each one of the 807 files that end with the word ".log" found on the EMS Server before the Dominion update was applied.

The Color code shows what happened to them After Dominion's update. Of all the files on the server Before the update – files highlighted in Green are still present on the server after the update, while files highlighted in light red have been overwritten and are deleted and not present in the image taken After the update.

Significant Number of Logfiles Missing

The dataset from which this spreadsheet was created was extracted from the EnCase images of the original evidence on the hard drives of the EMS Server and had a traceable chain of custody. While the images above are too small to be readable, the entire content of this list is reproduced in Appendix A.

Of the original 807 ".log" files on the EMS Server before Dominion's update, only 302 remain, and 505 ".log" files have been deleted or overwritten.

Of the files *that remain*, the forensic examination has not yet verified whether the content of these files (which have the same filename and Path – e.g., in the same directories) is unchanged. The files that have been deleted DO include files that constitute Election Records and are subject to Federal and State data retention laws.

This list is only 807 files, and the text size is so small that the content is barely readable. The list of files has been broken down into small subsets because the number of files on the entire server totals 363,321 files, many of which are provided by Microsoft as part of the Windows Server 2016 operating system and its associated application programs and are not Election Related and do not contain actual Election Data.

List of .evtx Event Log Files deleted

Figure 41 - EMS Server (5.11-CO) List of .evtx Event Log Files Before
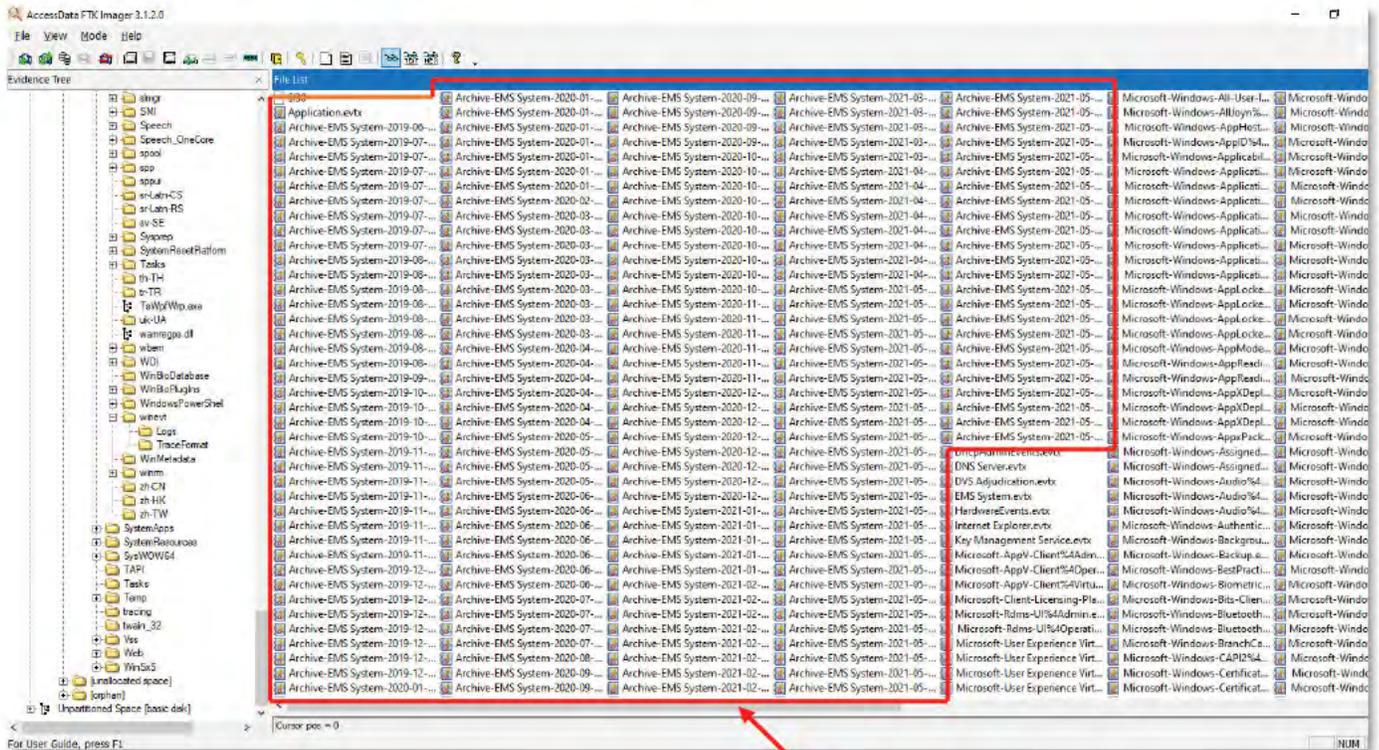

Figure 42 - EMS Server (5.13) List of .evtx Event Log Files After
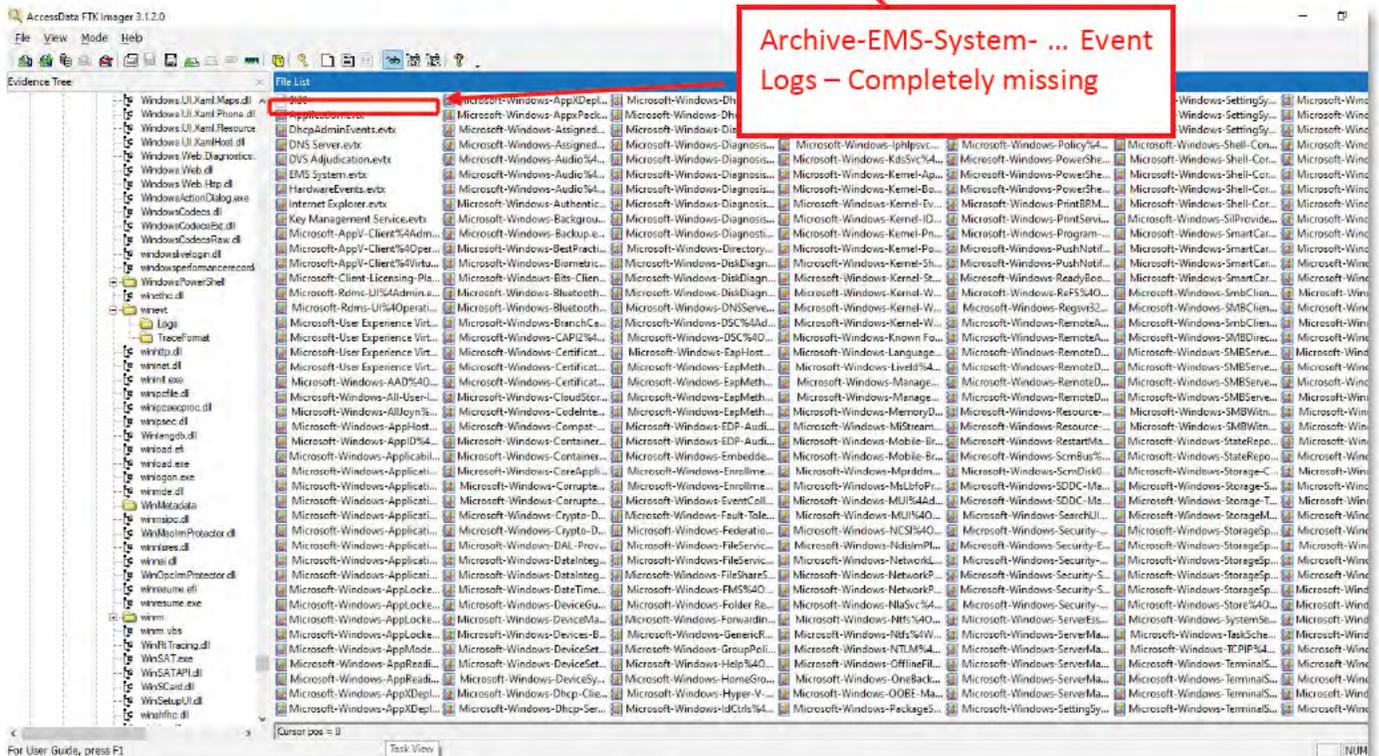

Archive-EMS-System- … Event Logs – Completely missing

This list that follows this paragraph is a comparison of the Before and After forensic images of the Mesa County EMS Server. It is a comparative list of files that were deleted – either deliberately erased or overwritten with disregard for the preservation of these files, some of which contain ELECTION RELATED data. A readable list is in Appendix C.

Each line in the image below is the full path listing (e.g., comparision of file names, not content) to each one of the 580 files that end with the word ".evtx" found on the EMS Server before the Dominion update was applied. 190 Event Log Files were deleted.

The Color code shows their status After Dominion's update. Of all the files on the server Before the update – files highlighted in Green are still present (although possibly changed) on the server after the update, while files highlighted in light red have been overwritten and are deleted and not present in the image After the update.

Analysis Summary

Analysis of the Mesa County Dominion Voting Systems EMS server identified that extensive deletion of both election data and election-related data, comprising election records which must and should have been preserved under Federal and Colorado law, has occurred either as a result of or coincident with the vendor's and CO Secretary of State's modification of the system from version 5.11-CO to 5.13. This deleted data is critical to any effort to reconstruct events taking place on the voting systems, and to determine if unauthorized access or operation of the voting systems took place.

Furthermore, the EMS server application logging functions are configured to "Overwrite events as needed" if arbitrarily-selected file storage sizes are exceeded, which could predictably and likely has resulted in the systematic, automated deletion of logfile content comprising election-related data.

This systemic deletion of logfile data requires additional investigation.

CONCLUSION

This forensic examination found that significant election record preservation requirements under the 2002 VSS and Federal and state law HAVE NOT BEEN MET and further that <u>destruction of Election-Related Data, specifically critical logfiles, has occurred</u>. This destruction is not incidental or minor but is *highly significant*.

These findings have been demonstrated in this report and evidence has been presented demonstrating *conclusively to both computer systems experts as well as legal professionals and the general public at large* that the facts in these findings support the conclusions that:

1) Election-related data and election data explicitly required to be preserved, as described in the 2002 VSS criteria referenced in this section, HAS BEEN DESTROYED IN VIOLATION OF THE LAW, and

2) The specific configuration settings of the server examined lead to the understanding that Certification Requirements for Voting Systems have likely not been met despite this system having been certified and thereby approved for use in Colorado by the Colorado Secretary of State.

Further investigation is required to determine the full scope of non-compliance with legal mandates for voting systems and election records, and whether the non-compliance is deliberate or simply negligent.

APPENDIX A. DELETED ".LOG" FILES AFTER DOMINION TRUSTED BUILD UPDATE

Deleted files are highlighted in light red. Files highlighted in green are still present in the server image.

APPENDIX B. SUPPORTING DOCUMENTATION: FILE DETAILS AND HASH SETS FOR SCREENSHOTS

The files below provide integrity data for the graphic screenshots in this document. Each comma-separated-variable (csv) file listed here contain the file name with its full path (e.g., directory structure) and message digest hash values (MD5 and SHA1 algorithms). Due to the length of the data contained in these files, they are provided in a compact disc (CD) addendum to this report.

Windows Defender Before.csv	Windows Defender After.csv	WebCache Before.csv	WebCache After.csv	Virtual Directories Before.csv	Virtual Directories After.csv
SSMS Install Log Before.csv	SSMS Install Log After.csv	SQLServer Logs Before.csv	SQLServer Logs After.csv	SQLServer Installation Logs Bef	SQLServer Installation Logs Aft
Inetpub Before.csv	Inetpub After.csv	Event Logs Before.csv	Event Logs After.csv	DHCP Before.csv	DHCP After.csv
Dell Server Update Logs Before.csv	Dell Server Update Logs After.csv	Databases Before.csv	CBS Logs Before.csv	CBS Logs After.csv	

APPENDIX C. MICROSOFT EVENT LOG FILES

Files in this list were ALL present in the EMS Server Before image. Files listed in RED were deleted or overwritten. Significantly, from their filenames alone, they are OBVIOUSLY Election-Related Records, "Archive-EMS-System-..."

APPENDIX D. LIST OF FIGURES

APPENDIX E. 2002 VOTING SYSTEMS STANDARDS (VSS)

The 2002 VSS explicitly states:

> "2.2.4.1 Common Standards
>
> To ensure system integrity, all system shall:
>
> ...
>
> g. Record and report the date and time of normal and abnormal events;
>
> h. Maintain a permanent record of all original audit data that cannot be modified or overridden but may be augmented by designated authorized officials in order to adjust for errors or omissions (e.g. during the canvassing   process.)
>
>
> i. Detect and record every event, including the occurrence of an error condition that the system cannot overcome, and time-dependent or programmed events that occur without the intervention of the voter or a polling place operator; and
>
> J. Include built-in measurement, self-test, and diagnostic software and hardware for detecting and reporting the system's status and degree of operability.

Furthermore, in 2.2.5.3, COTS (Commercial Off-The-Shelf) General Purpose Computer System Requirements, the 2002 VSS states:

> Further requirements must be applied to COTS operating systems to ensure completeness and integrity of audit data for election software. These operating systems are capable of executing multiple application programs simultaneously. These systems include both servers and workstations (or "PCs"), including the many varieties of UNIX and Linux, and those offered by Microsoft and Apple. Election software running on these COTS systems is vulnerable to unintended effects from other user sessions, applications, and utilities, executing on the same platform at the same time as the election software.
>
> "Simultaneous processes" of concern include unauthorized network connections, unplanned user logins, and unintended execution or termination of operating system processes. An unauthorized network connection or unplanned user login can host unintended processes and user actions, such as the termination of operating system audit, the termination of electon software processes, or the deletion of election software audit and logging data. The execution of an operating system process could be a full system scan at a time when that process would adversely affect the election software processes. Operating system processes improperly terminated could be system audit or malicious code detection.
>
> To counter these vulnerabilities, three operating system protections are required on all such systems on which election software is hosted.
>
> First, authentication shall be configured on the local terminal (display screen and keyboard) and on all external connection devices ("network cards" and "ports"). This ensures that only authorized and identified users affect the system while election software is running.
>
> Second, operating system audit shall be enabled for all session openings and closings, for all connection openings and closings, for all process executions and terminations, and for the alteration or deletion of any memory or file object. This ensures the accuracy and completeness of election data stored on the system. It also ensures the existence of an audit record of any person or process altering or deleting system data or election data.

Third, the system shall be configured to execute only intended and necessary processes during the execution of election software. The system shall also be configured to halt election software processes upon the termination of any critical system process (such as system audit) during the execution of election software.

And, in 4.3 Data and Document Retention, the 2002 VSS states:

All systems shall:

a. Maintain the integrity of voting and audit data during an election, and for at least 22 months thereafter, a time sufficient in which to resolve most contested elections and support other activities related to the reconstruction and investigation of a contested election; and

b. Protect against the failure of any data input or storage device at a location controlled by the jurisdiction or its contractors, and against any attempt at improper data entry or retrieval.

And the 2002 VSS states, in 4.4.3 In-Process Audit Records:

In-process audit records document system operations during diagnostic routines and the casting and tallying of ballots. At a minimum, the in-process audit records shall contain:

a. Machine generated error and exception messages to demonstrate successful recovery. Examples include, but are not necessarily limited to:

1) The source and disposition of system interrupts resulting in entry into exception handling routines;

2) All messages generated by exception handlers;

3) The identification code and number of occurrences for each hardware and software error or failure;

4) Notification of system login or access errors, file access errors, and physical violations of security as they occur, and a summary record of these events after processing;

5) Other exception events such as power failures, failure of critical hardware components, data transmission errors, or other type of operating anomaly;

b. Critical system status messages other than informational messages displayed by the system during the course of normal operations. These items include, but are not limited to: Diagnostic and status messages upon startup;

2) The "zero totals" check conducted before opening the polling place or counting a precinct centrally;

3) For paper-based systems, the initiation or termination of card reader and communications equipment operation; and

4) For DRE machines at controlled voting locations, the event (and time, if available) of activating and casting each ballot (i.e., each voter's transaction as an event). This data can be compared with the publiccounter for reconciliation purposes;

c. Non-critical status messages that are generated by the machine's data quality monitor or by software and hardware condition monitors; and

d. System generated log of all normal process activity and system events that require operator intervention, so that each operator access can be monitored and access sequence can be constructed.

And secton 6.5.5, Shared Operating Environment, in the the 2002 VSS states:

> Ballot recording and vote counting can be performed in either a dedicated or nondedicated environment. If ballot recording and vote counting operations are performed in an environment that is shared with other data processing functions, both hardware and software features shall be present to protect the integrity of vote counting and of vote data. Systems that use a shared operating environment shall:
>
> a. Use security procedures and logging records to control access to system functions;
>
> b. Partition or compartmentalize voting system functions from other concurrent functions at least logically, and preferably physically as well;:
>
> c. Controlled system access by means of passwords, and restriction of account access to necessary functions only; and
>
> d. Have capabilities in place to control the flow of information, precluding data leakage through shared system resources.

The foregoing Forensic Examination and Report was prepared by me and I am responsible for its content.

This _15th_ day of September, 2021.

DOUG GOULD
Chief Technical Officer

CyberTeamUS

Greenwood Village CO 80111

Re: Dominion Voting Systems Democracy Suite 5.13

Dear Mr. Case:

I am the forensic expert of record examining the Mesa County, Colorado Dominion Voting Systems (DVS) systems. I have examined forensic images of DVS Democracy Suite (D-Suite) version 5.11-CO used in Mesa County in the 2020 general election and in 2021 elections prior to its being updated in May of 2021 by DVS and the Colorado Secretary of State team. I have also examined the DVS D-Suite version 5.13 image that was installed in that update process. I authored two reports, delivered confidentially to counsel, that have since been released publicly.

The forensic copies of the voting system were made 2 days prior to, and 2 days after the execution of the DVS Trusted Build process that installed DVS D-Suite 5.13.

While in my opinion, the D-Suite 5.13 software that was installed in the trusted build process is a "default installation" of the software and lacks the expected local configuration necessary for an election (for example, each authorized person having their own userID and Password), and there are no "election projects" which would contain ballot definitions as well as tabulation databases, *as delivered* this system is not compliant with 2002 Voting System Standards (VSS).

The preliminary findings for Mesa County's DVS D-Suite v5.13 software include:
- The presence of Microsoft SQL Server Management Studio, ver. 17.1
  - Which is now on the list of software included in the certification document,
- The system is configured to overwrite log files that exceed 20 megabytes (20Mb)
  - Which will hold only approximately 302 entries based on the average log entry size,
- The software firewall (Microsoft Windows Defender) is configured to allow access from any IP address in the world to access the SQL service port (1433)
  - In fact every internet protocol is set to allow access from any IP address in the world,
- The system uses generic userIDs and a common shared password, some of which have administrative access
  - However configuration of an "election project" would be expected to change this.
- There may be wireless devices included in the election systems hardware that would require physical inspection (disassembly) to verify by visual inspection of internal system components in addition to the assembly data provided by Dell.

While it should be reasonably expected for a proper configuration to address these deficiencies, that finding is not in evidence for DVS D-Suite v5.13 in Mesa County. As examined, the DVS D-Suite v5.13 is not compliant with VSS requirements.

Sincerely,

Doug Gould
Chief Technical Officer, Cyber Team US

Report #2

Forensic Examination and Analysis Report

February 28, 2022

Table of Contents

Table of Figures

EXECUTIVE SUMMARY

This report documents findings in an ongoing forensic examination of images of the hard drives[1] of the Dominion Voting System (DVS) Democracy Suite (D-Suite) version 5.11-CO Election Management System (EMS) server of Mesa County, Colorado. The DVS D-Suite EMS server in that configuration was used for all elections held in 2020 and through May 2021, including the November, 2020 General Election, and the April, 2021 Grand Junction Municipal Election. This voting system represents a portion of the overall election system infrastructure in Mesa County and the State of Colorado. This report is limited to a subset of the findings of an ongoing investigation. Report #1 is incorporated by reference.[2] The findings in this report were prepared by me as a consultant to the legal team representing Tina Peters, the Mesa County Clerk and Recorder, pursuant to her statutory duties as Mesa County's Chief Election Official.

Critical Discoveries

This report details the following critical discoveries regarding Mesa County's voting system:

- **Uncertified software installed, rendering the voting system unlawful for use in elections.**
- **Does not meet statutorily mandated Voting System Standards (VSS) and could not have been lawfully certified for purchase or use.**
- **Suffered systematic deletion of election records (audit log files required by Federal and State law to be generated and maintained), which, in combination with other issues revealed in this report, creates an unauditable "back door" into the election system.**
- **Violates Voting Systems Standards ("VSS") which expressly mandate prevention of the ability to "change calculated vote totals." This report documents this non-compliance from the logged-in EMS server, from a non-DVS computer with network access, and from a cell phone (which may be possible if any of the 36 internal wireless devices in voting system components are deliberately or accidentally enabled and a password is obtained).**
- **Mandatory VSS "System Auditability" required features are disabled.**
- **Is configured with 36 wireless devices, which represent an extreme and unnecessary vulnerability, and which may be exploited to obtain unauthorized access from external devices, networks, and the Internet.**
- **Is configured through firewall settings to allow any computer in the world to connect to the Election Management System (EMS) server.**
- **Uses only a Windows password with generic userIDs to restrict and control access.**
- **Contains user accounts with administrative access that share passwords, subverting VSS-required user accountability and action traceability controls.**
- **Uses a self-signed encryption certificate which exposes the system to the risk of undetected compromise or alteration.**

---

[1] A forensic image of a hard drive is a bit-for-bit copy of the user accessible data storage area residing on the data storage mechanism used by the computer system; it is every byte of data accessible to the computer or user. For a complete discussion of this definition, see Appendix J.

[2] Report No.1 was issued on September 15, 2021 and can be downloaded at https://standwithtina.org/.

Most Significant Findings: The Voting System is Not Secure, Violates Security Standards Required By State and Federal Law

The most significant findings include the conclusive determination, based on testing, that the voting system is not secure and protections have not been implemented in accordance with the requirements of the Federal Election Commission's 2002 Voting System Standards (VSS) (see Appendix A). Those Standards constitute a mandatory minimum requirement for a voting system to be certified and used under Colorado law. Given the fundamental flaws in the security design and configuration of this system, there is no conceivable interpretation under which this voting system could be considered secure.[3] The fact that it was tested and certified for use vitiates claims of competency and trustworthiness of the entire regime of testing and certification being used, of truthfulness of testing and certification statements, of competency of the Colorado Secretary of State's office, and of the validity of any election results obtained from the voting system as used in any jurisdiction.

"Back-Door" found in Voting System; Uncertified Software Invalidates Voting System Certification

The combination of unauthorized software installed in the EMS server in 2017 (still present in violation of law in 2021), the failure to employ security mechanisms already built into the system and required by VSS, and the obliteration of mandatory audit logs (destruction of both election records and evidence of access to the EMS server) that Federal and State law require be preserved, create a "back-door" to the EMS server that is only partially protected by a simple password, with no preserved audit records. The existence of uncertified software violates the certification of the voting system and makes the use of the voting system in an election illegal. Indeed, University of Michigan Professor J. Alex Halderman,[4] a recognized computer science expert on electronic voting systems, testified under oath[5] that components of this Dominion Voting System ("DVS") are highly vulnerable to attack and that the system he examined is used in 16 other states, including Colorado. In his declaration he states under oath that this vulnerability in the Dominion voting system can be used to "steal votes", and requests the federal court allow him to give the Critical Infrastructure Security Agency (CISA) immediate access to his report detailing his findings.[6] The findings in this report agree with Professor Halderman's finding that the system can be used to steal elections.

---

[3] Even the Center for Internet Security (CIS) recognizes the need for these controls in their Handbook for Election Infrastructure Security: https://www.cisecurity.org/wp-content/uploads/2018/02/CIS-Elections-eBook-15-Feb.pdf. The National Institute of Standards and Technology (NIST), which chaired the development of the Voting Systems Standards extensively recommends the fundamental security principle of "Least Privilege" that has been ignored in the configuration of the EMS.

[6] *Id*.

A password was not necessary to access this EMS server.[7] There are many mechanisms by which a server can be exploited and administrative access obtained without a password; the National Institute of Standards and Technology (NIST) National Vulnerability Database (NVD) has identified over eight hundred of these admin-access vulnerabilities[8] (among hundreds of thousands of other vulnerabilities) since its inception in 2005, and the Common Vulnerabilities and Exposures (CVE) program operated by MITRE Corp. lists nearly 170,000 computer vulnerabilities[9] that are *publicly known* since its inception in 1999.

Capability to Easily "Flip" Election Results Demonstrated

Tests demonstrate the vote totals can be easily changed, commonly known as "flipping the election,"[10] in this critical Election Management System server. The VSS directs voting systems vendors, like DVS, to address this specific risk[11] but based on the software contained on the EMS that was analyzed, the vendor has not done so here. Further, the obliteration of audit trails (logs) on the EMS server makes it extraordinarily difficult (and maybe impossible) to forensically determine whether any external connection allowing unauthorized access to the voting system, wireless or wired, occurred before, during or after the elections.

This report describes the absence of legally required security features on the voting system and then demonstrates only a few examples of the many possible methods by which it is possible to change calculated vote totals and alter the results of an election as consequence of those security failures.

Voting System Components Manufactured and Assembled in China and Mexico

The Mesa County EMS server used through May 2021 (serial number 4NV1V52) was assembled in Mexico, and its motherboard was manufactured in China. It is well understood that foreign manufacture or assembly exposes the components to the risk of compromise through the installation of foreign-controlled access devices during manufacture in the reported supply-chain attack.[12]

Voting System Presents an Immediate threat and is Dangerous to use in the upcoming 2022 election

The tests conducted in this report demonstrate and document three test intrusions into the DVS Election Management System server using popular, commercially available software that allows easy access to vulnerable election records. Given even momentary access, a person with only moderate computer skills can perform such an intrusion. It is not possible to reconcile these massive security failures with the obvious

[10] The switching of calculated vote totals in an election has been identified in 2 other jurisdictions: Fulton County, Pennsylvania, and Antrim County, Michigan. *See* https://rumble.com/embed/vjr2u6/?pub=dw7pn which documents testimony of the Fulton County finding.

[11] "Changing the calculated vote totals," VSS, Volume 1, section 6.1, page 6-93. See Appendix A.

[12]   https://www.bloomberg.com/news/features/2018-10-04/the-big-hack-how-china-used-a-tiny-chip-to-infiltrate-america-s-top-companies; See Appendix L for discussion.

requirements for such an important piece of critical infrastructure. In combination with mandatory audit records being deleted in violation of state and federal laws that require their preservation, and in violation of evidence preservation orders for active legal cases [13], this EMS server presents an immediate threat to election integrity, with potential grave consequence to Colorado and the Nation by allowing the unauthorized alteration of election results.

The threat is immediate because 2022 election processes are already underway with primary elections imminent, and many jurisdictions will use these systems, and citizens' electoral franchise will be at risk, if citizens and public officials are not warned.

The initial installation and continued presence of uncertified software (Microsoft SQL Server Management Studio) in the Mesa County EMS Server is a violation of law.   However, the tests conducted for this report clearly demonstrate that it is not the SSMS software alone that enabled illegal access to and modification of election databases and scanned ballot images. The state certifying this software on a chronically insecure system does not remedy the system's chronic insecurity – it only obfuscates one problem (insecurity) with another (improper testing and certification).

In contrast to the testing and certification of DVS D-Suite 5.11-CO, the current certification in Colorado of DVS D-Suite 5.13 includes SSMS, but tests conducted in this examination demonstrate conclusively that the EMS system is insecure both with, and without, SSMS.

---

[13] Log files and other auditable records of normal and abnormal activity on computer-based voting systems are not only election records which must be preserved for 22 months according to Federal law, and 25 months according to Colorado law, they also represent evidence that is subject to document preservation requirements in existing civil litigation and, forseeably, for future civil and criminal cases.

Key Findings

Six Key Findings in this report are:

1.   The Mesa County EMS server used in the 2020 General Election had Microsoft SQL Server Management Studio 17 installed in May 2017. This software is not listed on the official test and certification report nor on the vendor's application to the Colorado Secretary of State for certification of DVS D-Suite version 5.11-CO signed by "Nick Ikonomakis," VP, Engineering [Dominion Voting Systems], dated 6/6/2019. As it was not listed, tested, or certified, the unauthorized installation of this software violates and renders illegal the certification of the election system, and its use in an election.

2.   The inclusion of unauthorized and uncertified Microsoft SQL Server Management Studio software, as configured, allows the bypassing of Dominion Voting Systems' software and enables any data in the vote databases to be changed. For example, using the uncertified Microsoft SQL Server Management Studio software, it is a quick and simple task to "flip" the vote (change calculated vote totals, demonstrated herein by changing only two values in the database to flip tens of thousands of votes).

3.   With the addition of a wireless access device (added to the test to emulate the presence of multiple wireless devices that exist on Mesa County's DVS hardware), the insecure configuration of the Mesa County EMS server allowed the editing and changing of the calculated vote totals using a standard iPhone. Wireless access, whether enabled accidentally or enabled/added deliberately (even in secret) to a voting system network, enables intrusion, attack, and compromise of any electronic voting system. The security configuration of the EMS server was wholly inadequate to prevent such intrusions. Thirty-six wireless access devices were identified built-in to the Mesa County DVS D-Suite system components, as documented by Dell and the Secretary of State's equipment inventory.

But, due to the DVS-specified configuration of the EMS, and the Secretary of State-approved procedures that overwrite audit records[14] – by mandating that the EMS server "overwrite" log files "as needed," and further, during the Secretary of State's so-called "Trusted Build" update which overwrote the EMS server, both in violation of federal and state laws - it is at best, extremely difficult to determine from EMS server audit log data how or even whether the wireless connections were used during or affecting Mesa County's elections.

4.   The exceptionally poor security configuration of the EMS server's operating system, firewall, and the improper and inadequate configuration of the SQL Server database management system (DBMS) enabled access to the election databases and the alteration of vote totals using freely available, non-DVS and non-Microsoft database app downloaded and installed onto on a cell phone.

---

[14] Approved, by certifying vendor supplied information. CRS-1-5-620 states that the vendor provides documentation including manuals to the Secretary of State, and any information not on file with and approved by the Secretary of State shall not be used in an election.

5. The Colorado Secretary of State's certification of DVS D-Suite version 5.11-CO for use throughout the state of Colorado was illegal,[15] given the overwhelming number of VSS compliance violations found within the EMS server, which undermine the credibility of the claimed testing, technical competency of the testing lab, and the Secretary of State's certification.

6. The Mesa County, Colorado EMS server as used in elections including the 2020 General Election, and the April 2021 Grand Junction Municipal Election, has been shown to be insecure and grossly misconfigured such that it could not prevent unauthorized access to the election database or, as explicitly required by the VSS, prevent "changing the calculated vote totals" (demonstrated using an exact forensic replica of the system). This constitutes a material violation of the VSS requirements. It was possible to access the EMS server and change only 2 numbers in the database to completely reverse the Mesa County election 2020 Presidential election results stored on the EMS server. If this was done during the election, the EMS server would have then reported the changed vote totals as its authentic result.

---

[15] The Colorado Secretary of State's certification of both DVS D-Suite 5.11-CO and 5.13 were also apparently illegal under state law, given that testing by a federally accredited testing lab is prerequisite for certification under Colorado law, and the Secretary's certifications both relied upon testing by an unaccredited voting system testing lab.

Analysis Summary: Compliance of Mesa County, Colorado, DVS D-Suite systems with the law

Four Key Objectives for this assessment are:

1. To determine whether implemented security capabilities comply with the 2002 Voting System Standards (VSS), mandatory under Colorado law;
2. To determine whether the results of an election stored on the EMS server can be altered by any person with physical access to the logged-in EMS server,
3. To determine whether the results of an election stored on the EMS server can be altered by any person using even a non-Dominion computer directly or indirectly connected to the EMS server network, and
4. To determine whether the results of an election stored on the EMS server can be altered by any person using a device such as a cell phone wirelessly connected to the EMS server network.

It is recommended that this report be viewed on a computer. Some of the screen images may be difficult to read when printed on paper, but viewed on a computer they can be expanded (zoomed in) and are easily read.

Documented in this report is a series of tests conducted as part of the examination to evaluate a few aspects of the security compliance[16] of the Mesa County, Colorado DVS D-Suite version 5.11-CO EMS server, and the findings from that examination. These tests were limited to the EMS server. The EMS server receives and stores ballots in the form of electronic ballot images and cast vote records (CVR) from each ballot optically scanned into ImageCast Central (ICC) scanning/tabulation machines, and tabulates the results of the election. The images, CVRs, tabulated results and all system log files that document every aspect of system state, access, and operation are critical election records. The EMS server is one of the most critical components of the voting system and the security of its election records is of paramount importance.

The examination began with no pre-conceived assumptions about vulnerabilities and security. An identical copy of the Mesa County EMS server hard drive image[17] was mounted and tested to exactly replicate the conditions of use during elections conducted between the installation of version 5.11-CO in 2019 and its replacement on May 25, 2021. The identified uncertified SSMS software component was installed earlier and very likely presented this same security weakness since its installation in 2017, but the scope of the tests in this report only addresses the 2019-2021 period. The computer-based voting system is extraordinarily complex and requires skill, knowledge, and diligence to configure securely. Despite being custom-ordered and then configured by the vendor, the critical nature of voting systems and the extreme importance of securely configuring these computer-based systems requires that voting systems be tested by competent cybersecurity professionals to determine their vulnerability. Colorado law requires only that

---

[16] The evaluation identified critical weaknesses in the system and this report documents those findings. A comprehensive evaluation of every possible defect is beyond the scope of this report; the investigation is ongoing.

[17] An identical copy of the Logical drive image, mounted within an Oracle VirtualBox virtual environment.

they be tested by a laboratory accredited by the U.S. Election Assistance Commission (EAC) and the results certified by the Colorado Secretary of State.

The DVS application to the Colorado Secretary of State for certification of DVS D-Suite 5.11-CO represents that this system "meets the requirements of the Colorado Secretary of State Election Rules (8 CCR 1505-1)" (which specify that all voting systems in Colorado must meet the requirements of the 2002 VSS).[18] This includes documentation of the "minimum services needed for the successful, secure and hardened operation of the voting system" and "contains security measures for all systems, software, devices (upload, download, and other programming devices) that act as connectors and any additional recommended security measures." While this provision of law addresses documentation to be provided, it is also necessarily required that the documentation be truthful and accurate. A forensic examination of this system, and tests performed in this examination, clearly show that these requirements are not met; the system is not secure and certainly not hardened against unauthorized access.

Testing confirmed that an outside party could use a separate computer as well as a cell phone, with publicly available and widely used free software (none of which were part of the DVS D-Suite), to easily change election results. The obliteration of audit trails on the EMS server by DVS and the Secretary of State personnel during the "trusted build" process diminished the ability to forensically determine whether any network connections (including wireless connections or intrusions) were made to the EMS server. Thirty-five wireless devices were identified on the DVS D-Suite system, including the ImageCast Voter Activation (ICVA) computer, serial number 2DX0Z52, ordered on August 16, 2015 by DVS for use in Mesa County. It was ordered by DVS configured with a Dell Wireless 1560 internal wireless adapter, providing both 2.4GHz and 5GHz (dual band) Wi-Fi and Bluetooth connectivity to and through that ICVA computer. In total, Mesa County was provided thirty-five D-Suite components with wireless capability installed: Dell Latitude 7450 computers providing ICVA functionality, serial nos. 8GX0Z52, 8JX0Z52, BCX0Z52 with Dell Wireless 1560 modules, and Dell Optiplex 9030 ImageCast Central (ICC) systems, serial nos. H4B4T52, H4G0T52, H4JBT52, and H4L9T52 with Dell Wireless modules. A Dell E310DW wireless printer was configured as the EMS server's default printer, with IP address 192.168.100.11, bringing the total number of wireless devices to thirty-six. Wireless device encryption can be easily broken,[19] and the vulnerabilities are online and in the Computer Vulnerabilities and Exposures (CVE) database.[20] A demonstration video of this intrusion is also available.[21] Twenty-eight (28) tablets, provided by DVS as ICX devices in the D-Suite system, include

8

wireless capability. The prior expert analysis and testimony of Professor Halderman further confirms the vulnerability of these Dominion ICX components to malicious attack and compromise by an outside party.[22]

Because of the extraordinary nature of the "back-door" identified and because internal wireless devices were included as part of the DVS D-Suite system used in Mesa County, I added a wireless access device to the server network during testing to properly replicate the actual hardware used in Mesa County. This enabled determination of whether the system vulnerabilities could be exploited with the more limited capabilities of a mobile device. This report describes testing that demonstrates how easily the design and configuration of this voting system allows this type of exploitation.[23]

The tests in this report first demonstrate that any person with physical access to the logged-in EMS system can change the election database results (calculated vote totals), with [24] or without [25] a userID and password, on the Mesa County EMS before, during, or after the election by using a few mouse clicks. By itself, the ability of any user to modify election database totals illustrates the voting system's non-compliance with VSS and Colorado law. The tests also demonstrate that if the voting system has any external connection for even a moment, a person anywhere in the world can change the election database results on the EMS server with a few mouse clicks. This is an extraordinary danger to election integrity.

The protection offered by use of passwords is further weakened by the fact that different userIDs created on the EMS server share the same password.[26] Shared passwords were also reported in the Maricopa, Arizona forensic audit.[27] Rudimentary security protocol demands that each userID must have its own unique password. The sharing of password across accounts renders ineffective individual accountability for actions by a user (each assigned a specific userID, required for access control mandated by VSS and the ability of audit trails to identify fraudulent activity). This renders the system noncompliant with VSS requirements. VSS mandates, among other things, that the system: (1) "establish and maintain controls that can ensure that accidents, inadvertent mistakes, and errors are minimized; (2) protect the system from intentional manipulation and fraud, and from malicious mischief"; and (3) identify fraudulent or erroneous changes to the system."[28] Other jurisdictions have learned that they do not have control of their voting systems but the vendor, Dominion Voting Systems, has the administrative passwords and, therefore,

---

[22] www.gaverifiedvoting.org/pdf-litigation/20200819-785_2-Declaration-Alex-Halderman.pdf

[23] The VSS expressly identifies the prevention of this type of manipulation in its security objectives for voting systems, VSS Volume 1, section 6.1, page 6-93, excerpted in Appendix A.

[24] I accessed the EMS server with and without a password. I was able to guess the password, and separately used a well-known password bypass technique, both methods were successful and I gained access to a copy of the EMS server in an Oracle VirtualBox environment.

[25] Passwords are easily bypassed, and knowledge of a specific password is not required, since access can be obtained without a password. See Appendix K.

[26] Thirty different userIDs on the Mesa County EMS server were found to share an identical password. Two of those accounts were enabled and active.

[27] Maricopa County Forensic Election Audit, Volume III, section 6.5.2.1.3

[28] (VSS V1, 6.1, page 6-93, see Appendix A).

control.[29] Mesa County's DVS EMS server has an administrator account installed specifically for Dominion Voting Systems' use.[30] In light of the legal and security responsibilities in the administration of elections, allowing a vendor (in this case DVS) to maintain administrator access to the voting system is inexplicable, as is the exclusion of local election officials from control over their own elections.

The names of account userIDs on Mesa County's EMS server, created during the installation of DVS D-Suite 5.11-CO, are generic. Generic account userIDs were also found in the Maricopa, Arizona audit.[31] This finding in Arizona strongly suggests that it is a DVS practice to use generic userIDs and the same userIDs are likely used on *every* DVS election system in the USA. As one of the two components of required authentication (userID and password), this is an extraordinary compromise of security, as it is likely that once a userID from one state is known, it may be known for *all* states.

The examination found that the EMS server network was active and in use; the Ethernet network interface was found to be enabled, an IP address was found to be assigned, and election databases and ballot images were found to be stored on the EMS 'NAS' disk drive. The drive was shared to the connected network.[32] Any representation that the EMS server was not connected to a network is false. The transmission control protocol / internet protocol (TCP/IP) port that supports direct back-end database access on the EMS server was found to be unprotected by anything other than Windows authentication (a common userID and a shared password) and any person who gains unauthorized access will have full access to ballot images and the tabulated vote databases, in violation of the 2002 VSS.

The tests conducted in this examination found the system to be insecure and also ensured that no protections that might otherwise have secured the system were overlooked by the examination process. No advanced security penetration techniques were needed; the initial access to the operating system (i.e., "login") was performed both by guessing the password as well as by using well-known and easy to find password bypass techniques. The unauthorized and uncertified Microsoft SQL Server Management Studio software[33] ("SSMS") on the EMS server was run and access to the SQL server databases on the EMS server, which should be highly restricted, was granted without restriction or challenge. This same access has been found in other forensic examinations of virtually identical DVS D-Suite voting systems used in at least two other states.[34] A non-Microsoft, non-DVS software application that supports SQL database access was also used (from an iPhone) and access to Mesa County EMS server election databases was obtained, allowing

[29] Maricopa County Forensic Election Audit, Volume III, section 6.5.3.1.3. *See also* https://www.western journal.com/az-audit-exclusive-election-systems-password-hasnt-changed-2-years-shared-time/.

[30] Account names are withheld in this report to protect the security of the system, since an account name and a password are literally the only things protecting this system.

[31] Maricopa County Forensic Election Audit, Volume III, section 6.5.2.1.3

[32] Dominion misleadingly refers to this as "NAS." It is not. NAS stands for Network-Attached Storage. This storage was found not to be network-attached, but instead, "direct-attached," and is thus a DAS instead of a NAS.

[33] D:\Program Files (x86)\Microsoft SQL Server\140\Tools\Binn\ManagementStudio\Ssms.exe.

[34] Analysis of the Antrim County, Michigan November 2020 Election Incident, J. Alex Halderman, March 26,2021, p.10; September 24, 2021, Presentation of Ben Cotton entitled *Arizona Senate Audit, Digital Findings*, slide 13.

changes to the calculated vote totals. Testing shows conclusively that the voting system was not secure and that protections required by law were not enabled.

Report #1 documented the destruction of system log files that voting systems are required to generate and preserve in order to comply with federal and Colorado law.[35]) Those critical election records would be necessary to allow a forensic examiner to identify whether any changes to the election databases were made, and when and how they occurred. This system did not preserve those election records,[36] in violation of federal and Colorado law. This failure was a direct result of the system configurations and technical guidance as directed by Dominion and mandated by the Colorado Secretary of State for all counties using D-Suite version 5.11-CO EMS servers. The installation of the voting system software update (called the "Trusted Build") by the Secretary of State, assisted by DVS personnel, in all DVS-equipped Colorado counties further overwrote and eradicated most records necessary to perform a forensic audit of the affected elections.

As a direct result of the destruction of those election records (in the form of log files that provide an audit trail required by law to be preserved), any examiner, much less a non-expert public official, will find it difficult if not impossible to determine conclusively that the voting systems have not been tampered with or operated in an unauthorized manner. Destruction of those election records prevents detection and/or confirmation that the vulnerabilities identified in this report were not exploited to alter election results.

A full, independent forensic audit should be conducted in any jurisdiction that used this system, given the extraordinary insecurity and non-compliance of this voting system with both legal standards and industry-recognized best practices and the failure of the existing testing and certification regime to detect those conditions,. Such an audit should include every component of the voting system, all electronic logs, removable media, and escrowed source code. Cast paper ballots should be examined for authenticity and then recounted in order to have confidence that the tabulated vote count matches the paper ballots. Because of the obliteration of audit trail data, audit techniques which rely upon small, statistical sampling of results (so-called "risk-limiting audits") are not reliable. No person can trust any result obtained from this system in any election in which it was used due to the extreme insecurity of this voting system.

Although this examination addresses the local Mesa County, Colorado election results stored on the Mesa County EMS server, similar destruction of election records and the security weaknesses that enabled it are highly likely to have occurred across Colorado and possibly other jurisdictions. The configuration of the

[35] Appendix A, VSS, Retention Requirement

[36] If not for the action of the Mesa County Clerk, who forensically preserved the Mesa County election records by backup of EMS server hard drive, the auditable record of the partial EMS server log files that remained from the November 2020 General Election and the April 2021 Grand Junction Municipal Election would have been destroyed by the Secretary of State's action and direction. That destruction of election records by DVS and the Secretary of State would have precluded a forensic audit of those elections and prevented the exposure of the voting system vulnerabilities as they existed in the November 2020 general election and the April 2021 Grand Junction Municipal Election. Failure to meet statutory-security compliance requirements would have been hidden from both public officials and the public. Neither the Secretary of State nor DVS instructed election officials to properly preserve these critical electronic records prior to these destructive "updates" and instead instructed them only to preserve ballot images and related election project files.

system is required to be tested by EAC-accredited testing labs, controlled through certification by the Colorado Secretary of State, and specified by Dominion Voting Systems (DVS), so it is almost certain this system is used throughout Colorado, and it is likely very similar, if not identical to systems used in other states.

Examination of the EMS server found that unauthorized Microsoft SQL Server Management Studio software[37] ("SSMS") was installed on 5/17/2017 at 06:49:44 AM. Given that the "trusted build" process was used in 2019 and overwrote all previous data on the Mesa County EMS server, SSMS must have been installed by DVS on its golden image of the D-Suite system; if it were installed by Mesa County staff, the installation date could not have preceded the DVS installation date of D-Suite 5.11-CO in 2019. SSMS remained installed on Mesa County's EMS server through the backup imaging conducted in May 2021. That software was present on the 5.11-CO EMS server but not listed on the Certification Application or testing report for the DVS D-Suite 5.11-CO system. This failure of the manufacturer to meet, the voting system testing lab to verify, and the Colorado Secretary of State to ensure that minimum Federal Voting System Standards were met, as required by law, is inexcusable and grossly violates industry standards. Only after this software was noted in an expert report, dated December 13, 2020, and submitted in connection with a widely publicized vote switching controversy in Antrim County Michigan involving DVS D-Suite systems, did DVS submit an application for certification for version 5.13-CO, dated Jan. 13, 2021 which listed SSMS as an installed software component.[38]

Name	File Ext	Logical Size	Category				File Created
Ssms.exe	exe	720,632	Executable				05/17/17 06:49:44 AM (-4:00 Eastern Daylight Time)

Figure 1 - SSMS Installation Date on Mesa County EMS server

The Colorado Secretary of State should have been aware that this separate software component (a completely separate download from Microsoft) was required to be listed on the application for certification, tested by a federally-accredited lab, and certified. The addition of MS SQL Server Management Studio is not necessary to the election process, and allows any party with access to the EMS server to alter cast ballots, tallies, databases, ballots, and audit records with up to full administrative permission.

Examination revealed fundamental flaws within the security configuration of the Mesa County Election Management System (EMS) server used in the November 2020 general election and the April 2021 Grand Junction municipal election that show conclusively that this voting system and its software, as delivered by Dominion Voting Systems and certified by the Colorado Secretary of State, is uncertifiable under Colorado law because it contains unauthorized, untested and uncertified software in violation of the law, is configured in a manner that violates mandatory VSS and industry best-practice security standards, allows "intentional manipulation and fraud" that the VSS standard prohibits, and fails to log system events and preserve audit trails required by VSS in a manner that makes determination of election integrity extremely difficult, and maybe impossible.

Nationwide, various election officials have denied qualified third-party investigators the access to election system equipment including logs, network and security equipment configurations, and network diagrams,

---

[37] D:\Program Files (x86)\Microsoft SQL Server\140\Tools\Binn\ManagementStudio\Ssms.exe.

[38] See Antrim Michigan Forensics Report, Allied Security Operations Group, December 13, 2020.

that might allow the detection of unauthorized access and operation of voting systems. This report demonstrates why this is a dangerous development because the denial of access prevents the discovery of the full extent of the failure of election security and election records integrity.

The techniques used in this report employ basic network troubleshooting techniques that can readily be executed by persons with minimal skills. In fact, software found to be already installed on the EMS server (Microsoft SQL Server Management Studio was downloaded and installed on the test workstation, while Fing and SQL Pro from the Apple App Store were installed on an iPhone). In each instance, the software was launched and access was granted. It was so simple that calling the test an "attack" is almost inappropriate, since standard publicly-available software was used without modification and connection was made in an industry standard manner to the default port assigned for SQL databases.[39] The server had no security implemented other than userID and password, and even that is easily bypassed.[40] In this case it was not a smart examiner but the exceptionally insecure configuration of the voting system that was at fault in failing to meet the requirements of law. That exceptionally insecure configuration is an open invitation to the average hacker, and indeed almost anyone with basic skills, to be able to change election results.

But it is not the average "hacker" or even cyber-criminals that provide the greatest threat to election integrity. While it has been stressed that these _relatively simple_ intrusions could be done by anyone with a reasonable understanding of networks, the fact is that nation-state adversaries have long attacked and subverted the critical infrastructure of the United States,[41] as documented in Appendix D. The extreme sophistication of these nation-state actors' cyber threat capabilities has persisted for decades, evolved far beyond the knowledge of the average citizen, and the history of publicly-known attacks document it beyond question. Malicious actors, including foreign nation-states, our most capable and persistent adversaries, already know how to subvert insecure systems, like this election infrastructure.

The evidence of foreign interest in our voting systems is too important to bury in a footnote: four (4) Korean students, at 2 different Korean universities, authored the paper A Study of Vulnerabilities in E-Voting System, Xing Shu Li, Hyang ran Lee, Malrey Lee and Jae-young Choi, _Advanced Science and Technology Letters Vol.95_ (**CIA 2015**), pp.136-139, https://www.researchgate.net/publication/315040247_A_Study _of_Vulnerabilities_in_E-Voting_System. Section 2 discusses "hybrid election systems" that are exactly what the Dominion Democracy Suite elections systems are.

Continued suppression of the knowledge of this system's extreme security failures, long known to foreign nation-states and others, does not further the security of critical infrastructure election systems – indeed, elections have taken place and are ongoing while these known security failures have been left unaddressed.

For example, in his September 21, 2021 Declaration, Professor Halderman attached an email string with CISA dated August 18-19, 2021, wherein he requested that the federal district court allow him to

---

[39] The standard port for SQL database access is 1433. When this port is found open, it is obvious that it provides access to a database system. The port number can and should be reassigned to another number to improve security, making the discovery of database access more difficult, and is an example of multi-layered "Defense in Depth."

[40] Appendix K.

[41] https://www.whitehatsec.com/blog/2020-election-security-the-urgent-need-to-address-vulnerabilities-in-voting-systems/

immediately provide his sealed expert report to CISA because of the threat posed to the election systems in sixteen states—including Colorado—by DVS machines with ICX software that can be used to "steal votes." In that August, 2021, exchange, CISA agreed to receive Halderman's expert report detailing these security failures. However, even though Professor Halderman testified in his Declaration that this threat was "urgent," and that it would take "months" to fix these "critical vulnerabilities," CISA inexplicably waited to even seek Prof. Halderman's report until more than five months had passed—to January 21, 2022.[42] The voting systems Halderman described as critically vulnerable were used in the November, 2021, elections in the U.S., including in Colorado. Thus, the suppression of knowledge of security failures has indeed harmed election security and faciitates continued malfeasance.

The security and configuration of the equipment images examined to date leaves no doubt that our voting systems are dangerously insecure, and renders absurd any claim of election integrity.

This examination has demonstrated the ability for any individual to change the calculated vote totals in the internal database tables used in an actual election, bypassing any Dominion Voting System software security and access controls, with no record preserved in log files that are meant to comprise an audit trail of election records. It demonstrates how trivially election results data can be tampered with and even changed completely by someone with physical access to the EMS server, or by using a non-DVS computer attached to the network, or even by using a cell phone or mobile device if wireless access has by any means been enabled on the network.

---

[42] Statement of Interest [by CISA], *Curling et al. v. Raffensperger et al.*, 1:17-cv-02989-AT, Docket No. 1269-1 (filed February 10, 2022), (ND Ga.).

EXAMINATION METHODOLOGY

Description of the Examined System

The voting systems used in Mesa County, Colorado, like other systems used across the state and the nation, are made by Dominion Voting Systems (DVS). Many of these voting systems are comprised of an industry-standard computer[43] that uses a Microsoft operating system and a combination of proprietary Dominion application software and non-proprietary, commercially available software. This provides a foundation for election-related functions including creating election projects, defining ballots, capturing and storing the election data in a secure database management system, tabulating and counting the votes, and reporting election results.

The Mesa County Election Management System (EMS) server runs on the Microsoft (MS) Windows Server 2016 operating system, and it employs a database management system known as Microsoft SQL Server (SQL Server). The security of the server depends largely upon the proper configuration of the operating system, network, and the SQL Server.

The design of the voting system includes the functional capability to adjudicate ballots that the computer cannot accurately interpret. Adjudication, in this regard, means nominally, that a person sits in front of a computer terminal, a ballot image is shown on the screen, and this person chooses the option that they feel the voter intended to choose. Adjudication is facilitated by a software application that runs on the EMS system (part of the DVS software) and, normally on one or more Adjudication workstations. If unauthorized code is executed on the EMS system, including on Adjudication workstations or other DVS workstations authorized to be connected to the EMS server, or if an unauthorized user is accessing or has accessed an Adjudication workstation, the adjudication function may be executed to adjudicate ballots without the intervention or knowledge of any authorized operator.

 This process requires that the EMS server (which stores and provides access to the election databases and ballot images) be connected to a network. While necessary for the adjudication function to work in the present design of the voting system, this design requirement significantly raises the risk of abuse, especially considering the failure to implement required security.

The Mesa County election director at the time reported that the D-Suite 5.11-CO network consisted of a single network switch connecting only specifically-designated components of the voting system, including the EMS server, adjudication workstations, an EMS server client workstation hosting the Election Event Designer (EED) software, and a Network Attached Storage (NAS) file server.[44] DVS documents the connection of these systems in their manuals. Therefore, while the EMS server may not have been directly connected to the Internet (it is impossible to rule out, without access to all logs which should have been generated and preserved), it was connected to other computers via a network to allow specific voting system devices to communicate with each other. These other computers must be fully examined to assure

---

[43] An "industry-standard" computer is comprised of common components (motherboard, bus, memory, processors, communications, input/output ports) in a common architecture, e.g., the type of computers one purchase in big box stores and find in use in a home-use or business setting, running office productivity and web-browsing software.

[44] The term Network Attached File Server is, in this case, a misnomer. DVS uses the term NAS, however it is a shared disk drive on the EMS server itself. In this report, I may use the term synonymously, but there is a difference that will be noted where relevant.

that no connection to external devices or networks (including the Internet) occurred, because connection to other computers exposes the EMS server to a common "Island-Hopping attack,[45]" which is where every device attached to the EMS network may have a direct or indirect path to and from a device or network outside of the election network, providing a path for an attacker's movement through networked devices to the target. For example, the computers in a home are typically all connected to each other via a wired and/or wireless network, and because the home router is connected to the internet, all devices in that home also have a path to the internet.

The voting system network (based on DVS manuals, EMS server image information, and election official input) was reproduced, both with a virtual network environment and again with a physical Ethernet network composed of cables and a small desktop network switch, to allow the network connection of a Test Workstation used in this report. This configuration was used to test access to the EMS server by a person sitting in front of the EMS server, and again to test access to the EMS server by even a non-Dominion computer that connects to this network. To test whether access from a device with more limited capability such as a mobile phone was possible, a wireless access device was added to the network to simulate the hardware used in Mesa County and the enabling, through misconfiguration or malicious action, of one or more of these wireless devices to provide access, even temporarily. Because I did not physically see or examine the original setup of the voting system network in the Mesa County facility, and due to the destruction of log data by both improper configuration and the overwriting of log files, it is not possible to provide conclusive forensic verification that the voting system was not connected to <u>unauthorized</u> external networks or devices, including wireless devices.[46] It should be noted that seven internal wireless adapters, and twenty-eight wireless-equipped ICX devices, were ordered as components of the Mesa County DVS D-Suite system, as supplied by DVS. In addition, a Dell E310DW wireless-capable network printer was configured as the default printer on the Mesa County EMS server. This brings the total number of wireless access devices to a total of thirty-six devices.

The EMS server has a software firewall. The purpose of having a firewall is to address the risk of access to the EMS server from all unauthorized devices, users, networks, methods, ports, Internet Protocol (IP) addresses or groups of addresses, and during specific time periods. However, a firewall must be specifically configured (programmed) to perform these functions. One risk of a software firewall is that all users with administrative access can change its programming because it resides on the EMS server; a separate hardware firewall device with its own non-shared password mitigates this risk. Per the VSS and required

---

[45] In an Island-Hopping attack, a threat actor gains access to a target computer remotely, through other, connected computers or devices. E.g., a target computer (which we'll call "A") is connected to computer or device "B" (e.g., a network printer). Computer or device "B" is connected to computer or device "C" and computer/device "C" is connected to computer/device "D". It is not necessary that they all be connected in a single physical network. In fact, most modern computers have one or more wireless communications devices; such a wireless capability could allow the access that enables an Island-hopping attack. It is not necessary that the connection be of long duration. The attacker might enter and compromise computer "D" from the global Internet over a wireless connection, determine that computer "C" is connected, break-in to computer "C, move through its connection to computer "B," and finally to computer "A" (which is may be particularly vulnerable if there is an assumed trusted relationship/connection between computers "B" and "A." This chain of connection and intrusions ultimately allows the complete compromise of the target computer.

[46] More detail will be provided in a subsequent forensic report.

by Colorado Law,[47] risks that must be addressed by a voting system include "Preventing access to vote data, including individual votes and vote totals, to unauthorized individuals." The EMS server firewall was found to be programmed specifically to permit access to back-end database services, enabling access to vote data and vote totals[48] on the Mesa County EMS server from ANY IP-address, globally, at any time. This configuration fails to meet requirements in the law, as well as every industry best practice recommendation for firewall rule configuration.

SQL Server, a database management system (DBMS), installed and used on the EMS server (which stores and manages the election databases) is accessible using any software tool supporting connection to SQL Server, employing Windows Authentication. One of the most common and freely available tools is known as Microsoft SQL Server Management Studio ("SSMS"). SSMS is free and available to download from Microsoft from any internet connection. In this examination it was downloaded from Microsoft, installed on the test workstation, and in a matter of minutes, used to easily and directly access the back-end election database and change any data in it. Searching the internet for 'how to install SQL server management studio,' the first result was: https://docs.microsoft.com/en-us/sql/ssms/download-sql-server-manage ment-studio-ssms?view=sql-server-ver15, which walks anyone through installing the software while other readily-accessible online videos walk even a novice through the installation.

But even that is not required for anyone with physical access to the EMS server, because SSMS software was found already installed on the Mesa County EMS server image. This software is not on the list of certified software for DVS D-Suite 5.11-CO nor reasonably expected on a voting system, due to the vulnerability it introduces. This addition in itself violates the stated certification of the voting system.

Software (SSMS) that allows direct access to the back end of the election results database and allows changing vote totals was found installed and functional on the Mesa County EMS server. The software firewall, that could have severely restricted access, was programmed instead to allow access from anywhere in the world. Although the VSS does not specifically address firewall configuration, it does specify addressing this kind of risk, and the firewall, supplied by Microsoft as part of the computer operating system could have and should have been programmed to limit access, at a minimum to only those Mesa County devices required to connect to the EMS server (the few other DVS D-Suite computers and devices necessary could be restricted by their specific IP addresses, for example). Such a configuration would also prevent the wireless access demonstrated by my tests and documented in this report, by disallowing its connection, had the firewall been used to control this database access (port 1433, or an alternate port, explained later in this document). However, given the presence of internal wireless devices as part of the DVS D-Suite system, a properly configured firewall rule on the EMS server that restricted access from only other Dominion devices on that network still may not prevent unauthorized access from occurring through the individually-authorized yet wireless-capable devices.[49] Possibly most alarming, I found a firewall rule that allows global (from anywhere in the world) access, is not supplied by Microsoft, and must have been explicitly created. Allowing global access is extraordinarily irresponsible, particularly given that SSMS enables direct access to the vote data. This dangerous combination constitutes what is commonly known

---

[47] See VSS Volume 1, section 6.1.

[48] This firewall could have prevented access but instead specifically allowed it.

[49] This means that the security implemented on every one of these connected devices must be as strong as that of the server that holds and tabulates ballots.

as a "back door" into the voting system, and together with deleted audit trails presents an undetectable path for unauthorized access to, and illegal manipulation of, election data. The failure of the software firewall is not the only access control that was misconfigured. Access control mechanisms in the DBMS itself failed to prevent the access demonstrated in these relatively simple tests.

It must be emphasized that this test was done on a virtual replica of the Mesa County EMS server, created from an image of that EMS server's hard drive, and not on the actual in-use election system.[50]

For all practical purposes, the term "Mesa County EMS server" is used to mean the logical image[51] of the Mesa County EMS server recreated from the forensic, integrity-controlled Encase Forensic Archive of the actual Mesa County EMS server. The original forensic image of the system was obtained using Access Data's Forensic Tool Kit Forensic Imaging software. Access Data is an industry-standard forensic software vendor. I had no access to the actual Mesa County EMS server hardware and have relied upon forensic images of that server furnished by legal counsel to create a virtual replica of the EMS server.

Access was attempted and established to the (replica) EMS server to determine the degree to which the EMS server was secured in accordance with legally-mandated VSS standards. The results were alarming. It was found that the SQL Server databases on the Mesa County EMS server were unprotected, beyond a simple password that can be bypassed.[52] While many potential security restrictions were possible, it was found that surprisingly few were implemented. The SQL Server software on the EMS server was set up with a Windows Firewall with Advanced Security features, however, an explicit firewall rule on the EMS server allowed access directly to the SQL election databases back-end from any IP address in the world.

Security settings relevant to the SQL Server and access to the databases were examined. A subsequent report will address the comprehensive security implementation. This report focuses upon the EMS server's failure to protect the election databases and the ease with which they can be accessed by any bad actor to change election results.

---

[50] A forensic image of a hard drive is a bit-for-bit copy of the user accessible data storage area residing on the data storage mechanism used by the computer system. For a complete discussion of this definition, see Appendix J.

[51] The exact view of disk storage data as seen by the EMS server computer.

[52] Appendix K.

FORENSIC ANALYSIS

SYSTEM IDENTIFICATION

The Mesa County, Colorado EMS server analyzed in this report is capable of operating on a local area network (LAN). The network consists of several systems, including servers and workstations. The server that was evaluated was named EMSSERVER. It is running the Microsoft Windows Server 2016 operating system.

The forensic evaluation and reviews were based upon a forensic image[53] archive collected from the Mesa County EMS server. The forensic image of the EMS server examined in this work was collected on May 23, 2021, before the Secretary of State staff, assisted by DVS personnel, installed their "Trusted Build" software update, as documented below. The serial number of the hard drive shown in the collection data set verifies the data origin to be the physical device.

The backup image was obtained, using forensic imaging methods (an AccessData FTK Imager), from the DVS D-Suite EMS Standard Server, version 5.11-CO, in Mesa County, Colorado, as used in the November, 2020 election.   The acquisition data are presented in Figure 2.[54]

---

[53] A forensic image (forensic copy) is a bit-by-bit, sector-by-sector duplicate of a physical storage device's user accessible storage area using specialized hardware and software. To be technically accurate, hard drives contain a "service area" that is not accessible by the user or the Operating system, nor by forensic software; this service area is accessed by the drive's internal controller. The service area is used by the firmware in the disk drive to identify defects in the media introduced during manufacture as well as those identified during operation. Making a perfect magnetic storage platter would be prohibitively expensive thus they are made to be fault tolerant, and the defective areas are simply skipped by using a defect-map. Forensic imaging is a much more comprehensive representation of the state and configuration of the imaged system than could be obtained using simple file backup methods. Forensic Imaging copies data from the subject data storage media without altering the original data in any way. The image includes all files, folders, and unallocated, free, and slack space as well as copies of internal Microsoft files that are protected from access during a normal backup (including the MS "Registry database" and other protected files). These forensic images include not only all the files visible to the server operating system but also deleted files and fragments of files left in the slack and free space as well as every digital bit of data present on the storage medium. When multiple disks are configured into a Redundant Array of Independent Disk (RAID) array, the RAID controller provides a "logical view" of every bit on the media to provide a sector-by-sector bit-for-bit copy of the storage medium; this permits, for example, the use of two identical disk storage devices to provide double the space of a single device, or two devices configured as mirror images of each other to provide failure redundancy. While there are many different configurations for RAID subsystems, a RAID subsystem provides the exact same view of the storage medium and data access to a forensic imaging process as it does to the computer in which it is installed.

[54] To the extent that personal identifying information was identified in Figure 2, it has been removed. This in no way affects the accuracy of the findings in this report or the evidence.

Figure 2 - Mesa County, Colorado EMS server (5.11-CO) Forensic Image Attributes

AUTHENTICITY

When forensic images are acquired, a hash function[55] is computed. This hash function is far more than a checksum, despite the "checksum" reference in Figure 2. The mathematical complexity of the hash function is sufficient such that there is only an infinitesimally small probability that any two different source files can produce the same resultant hash.[56] This hash can be used at any time to validate the integrity of the image to ensure that it has not been edited, modified, or changed in any way. The hash function result from the acquisition of data appears in the text above but also appears inside each respective archive and authenticates the data by demonstrating it has not changed since it was acquired. Moreover, two different hash functions (MD5 and SHA-1) are in the image and have never been shown to be simultaneously compromised in the same attack.

The hash function results were compared and match the data from the original collection of the forensic image. This provides the greatest mathematical assurance possible that the data in the forensic image examined is a true, authentic and unaltered copy of the original disk data.

Further confirmation that these are genuine images from the Mesa County EMS server has been provided by the Colorado Secretary of State's office. See:

https://www.sos.state.co.us/pubs/newsRoom/pressReleases/2021/PR20210817MesaCounty.html[57]

Chain of Custody

Digital chain of custody is the record of preservation of digital evidence from collection to presentation in the court of law. This is an essential part of the digital investigation process. The chain of custody is probative that the digital evidence presented to the court remains as originally collected, without tampering. The image analyzed in this report was obtained through AccessData FTK Imager 4.2.0.13.

---

[55] A hash function is a mathematical algorithm that converts an input (e.g., the bits of a file, or all the files on the hard drive) of arbitrary or variable length into an encrypted output of a fixed length. The purpose of the hash in this case, is to create a "signature" for the file or hard drive, such that any other party at any other time, can compute the hash of the file, files or hard drive and confirm that they are identical, because the hash outputs match.

[56] While the SHA-1 128-bit algorithm has been found possible to compromise, the attack required 9,223,372,036,854,775,808 computations of the algorithm. This is the equivalent of 6,500 years of single-CPU computations or 110 years using today's modern Graphics Processing Units (as used in mining cryptocurrency). This attack required the use of two specifically-designed different files that produce the same hash, created by expert mathematicians explicitly for this purpose. Such an attack may be within the capability of a Nation-State or by spending an enormous amount on cloud computing. In its application as a sophisticated checksum, the effort to change an original dataset into a specific altered dataset with the same hash would present astronomical difficulty much greater than the 9.2 quintillion (quintillion means x 10^{18}) computations in the attack referenced here, would require extraordinary resources, financing and would be exceptionally difficult to conceal. The likelihood of this occurring is infinitesimally small. The likelihood of this occurring undetectably is virtually zero. The probability of two different message digest algorithms being simultaneously fooled is nearly impossible and has never been shown to be possible.

[57] Reproduced in Appendix M.

I have reviewed the documented chain of custody for the image and have determined that the chain of custody is complete from the forensic operator utilizing FTK Imager through the source from which I directly received these images. (Because of the pending civil litigation and criminal investigation, the written documentation remains in the custody of counsel for later introduction in court proceedings and thus is not included as part of this report.)

Tools Used

The initial forensic image was acquired using Access Data FTK Imager. Once acquired, Encase Forensic was used to maintain forensic integrity of the archive. Autopsy, Encase Forensic, FTK Imager and Oracle VirtualBox were used to analyze the image. All findings were verified with Encase Forensic examination of the integrity-controlled forensic image.

TEST PREPARATION

The Mesa County EMS server forensic Image was used to recreate a complete and exact replica of the Mesa County EMS server's software, operating system, and even boot code, which was then launched in an Oracle VirtualBox[58] virtual computer environment for the examination. This technology is commonly used in software development and testing. This exact replica was used for this examination.

The image was evaluated to gather technical information, including the integrity of the data stored on the system. No effort was made in this analysis to reverse-design, de-compile, or reverse-engineer the compiled binary Dominion Voting System software. Operating system configuration relevant to the operation of the system as well as DBMS configuration was examined. Results relevant to this investigation are documented.

Screenshots are presented that can be used to review and verify these findings and provide step-by-step instructions to reproduce and validate these results. The security of the system has been compromised by the vendor, the Voting System Testing Lab and the Secretary of State's unlawful certification that the system meets all the requirements in law, and exacerbated by false statements that voting systems are safe, secure and have strong integrity. These test results verify the fact. These screenshots were obtained from the mounted forensic images of the EMS server. These results can be reproduced by anyone.

While many of the EMS server settings can be determined from operating system configuration records, it is much easier and far more understandable to view the same information with the Microsoft applications designed for this purpose. The software that serves as the host for the DVS D-Suite voting system applications is the intellectual property of Microsoft, e.g., Windows, SQL Server, and SSMS. The configuration values, or "settings," are determined by the end user, in this case DVS or the Secretary of State of Colorado, but are not proprietary. These are the settings that must be examined, as part of a comprehensive examination, when a voting system is tested for certification.

---

[58] The VirtualBox environment provides all of the resources that a server provides, including central processing units (CPUs) and network interfaces. Virtual means that many of the functions normally executed by dedicated computer hardware are instead performed in software, and the interfaces present on the original server are emulated by the host computer's interfaces. None the less, a virtual environment allows us to operate an operating system and application programs *as though* they were running on the actual server hardware.

The security of the entire voting system depends on the totality of all the hardware and software, *combined with* the configuration settings and records of system activity preserved in system log files. Similarly, the security of a home depends not just on having 3 doors and 21 windows, but also whether each of them are locked, as well as whether each of them are monitored on video (equivalently, access being logged) and whether they are each monitored by an alarm system.

The design of the system can be more secure or less secure, inherently, just as a house with 1 door and 1 window is more secure than a house with 10 doors and 20 windows. But voting system testing labs (VSTL) are explicitly required to check and verify these critical settings.

Below are presented screenshots from two different computers used in the testing environment. Each step is explained in detail so that one can easily follow along.
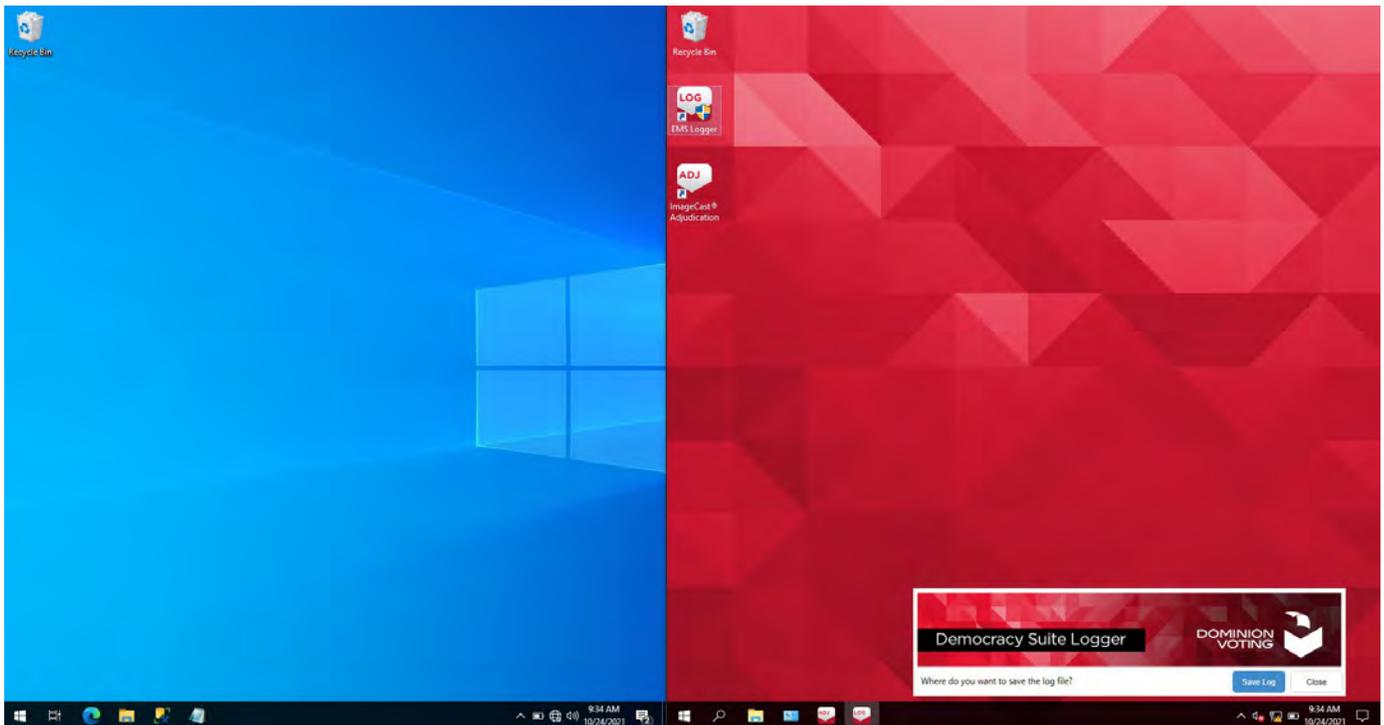

Figure 3 - Test Workstation and Dominion EMS server

On the left side in blue is the Test Workstation running the Microsoft Windows 10 operating system that was used as part of testing. On the right side in red, the emulated Mesa County EMS server, from the EMS Server image, is displayed. The EMS server operating system is Windows Server 2016 and is configured exactly as it was when the image was taken on May 23, 2021. These computers are connected to the same network[59] for testing.

---

[59] The EMS server has its IP address assigned as 192.168.100.10, just as it was while in operation in Mesa County. The Windows 10 computer is also set up on the same 192.168.100.0/24 network just as any device could have been connected at Mesa County. The figures shown in this report are taken from two "virtually" connected virtual environments on a single computer, but the results were verified and duplicated using two different computers and

Both systems are hosted in Oracle VirtualBox virtual environments on an isolated virtual network (emulated within VirtualBox) for the first test – these two computers[60] are the only computing devices connected to this virtual network.

The tests were repeated a second time using a physical network connection from a stand-alone test workstation with Windows 10 (within a separate Oracle VirtualBox instance, for forensic sterility) connected by Ethernet cable to a Netgear GS108 gigabit network switch, and then to the VirtualBox instance of the Mesa County EMS server's host computer.

This implementation, and testing with a physical network, together, exactly mimics the functionality of the Mesa County EMS server because it is running the exact operating system and application software, identically configured because it is an exact copy created from the integrity-controlled forensic image. Thus, its response and security controls are identical and well-suited for examination in this manner.

The Mesa County EMS network was connected to other components of the EMS D-Suite, but these components neither participate in, nor could prevent the accesses demonstrated in this test (if not compromised and exploited). They are, with respect to the conclusions of these tests, irrelevant, notwithstanding the possible additional data paths to external networks they may offer in either direction.

---

a physical network and network switch, i.e., the test's connection between the two systems made no difference on the results obtained.

[60] The reference to "Computers" in this paragraph specifically refers to the operational system comprised of electrical computing devices which perform identical functions and the software installed and configured to operate those devices. For example, an Intel i7 Central Processing Unit (CPU) performs identically on every computer motherboard provided that all of its features are properly included in the electrical design of the motherboard. The main characteristic of a computer is determined by the Operating System, its configuration, and the application software and its configuration. Thus it is entirely appropriate to examine the Operating system, application software and their respective configurations to understand the computer system's operational capability and function. The reference to the software as "computers" is intended to describe the software's purpose, capability and functionality as used in Mesa County as a computer system, not to a specific device.
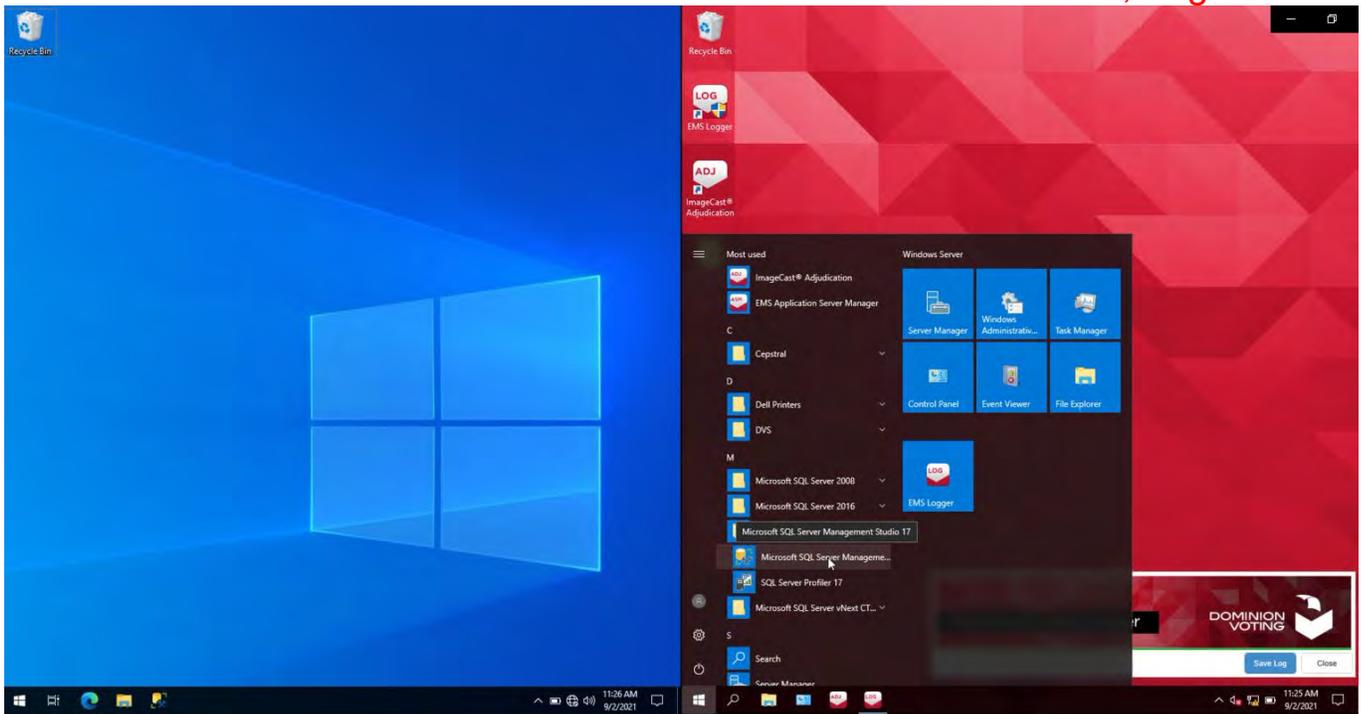

Figure 4 - Installed Microsoft Software

As the Dominion EMS server was examined, the installed Microsoft SSMS software was found listed on the Start Menu.

The presence of SSMS software on the EMS server was unexpected because it enables direct access to the EMS server databases, bypassing the DVS application software. Properly-designed software developed with security in mind would strictly require all database access of any kind (including backup and maintenance) to go through security/tracking/auditing components as part of the design.

The very dangerous side effect of having or allowing Microsoft SSMS software on a voting system is that it can enable surreptitious access to the voting database and is a concern if it is configured to allow such access. Therefore, it is necessary to examine the EMS server's entire software configuration.

Finding 1: The Mesa County EMS system used in the 2020 General Election had Microsoft SQL Server Management Studio 17 installed as configured by Dominion Voting Systems. This software is <u>not listed</u> on the official test report or application for certification. As it was not tested, the unauthorized installation of this software violates and renders illegal the certification of the voting system for use in an election.
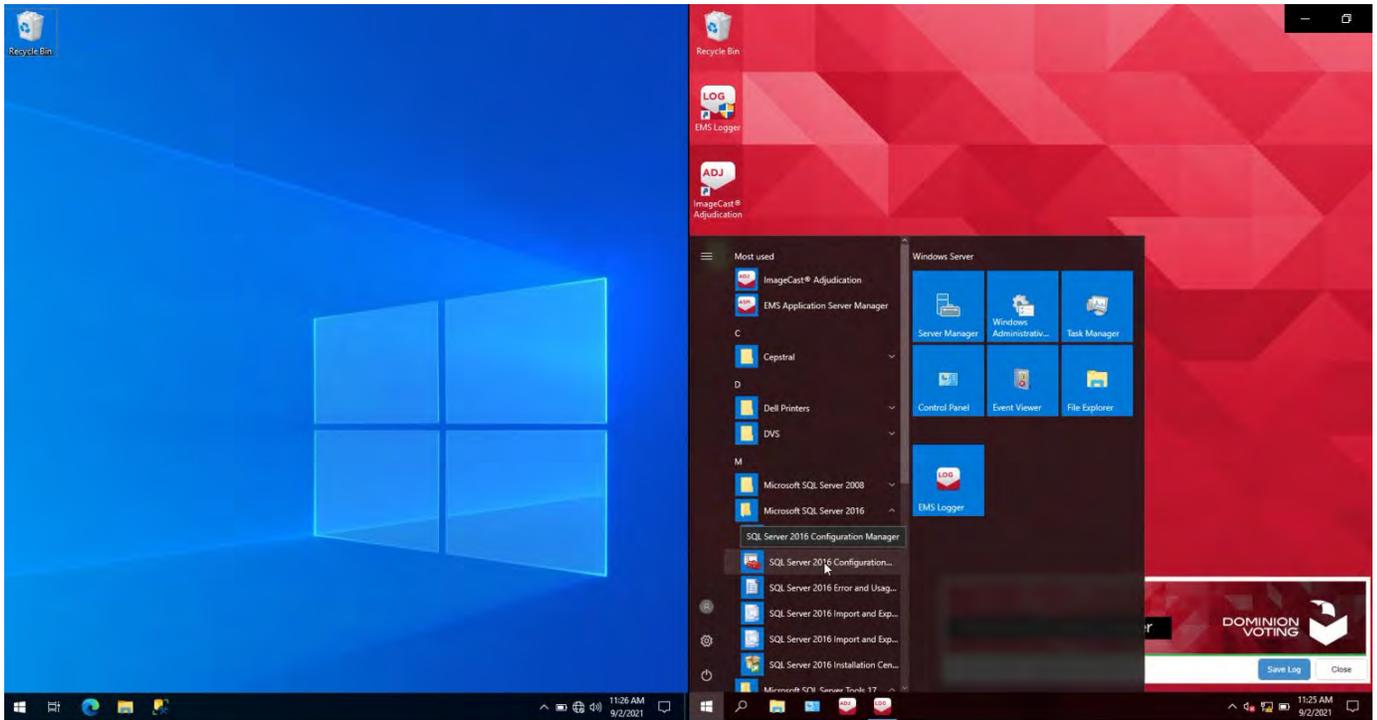

Figure 5 - SQL Server 2016 Configuration Manager

To determine how the SQL Server is configured and whether unfiltered and uncontrolled access is permitted, I examined its configuration through the software application provided by Microsoft entitled "SQL Server 2016 Configuration Manager" as shown in Figure 5.
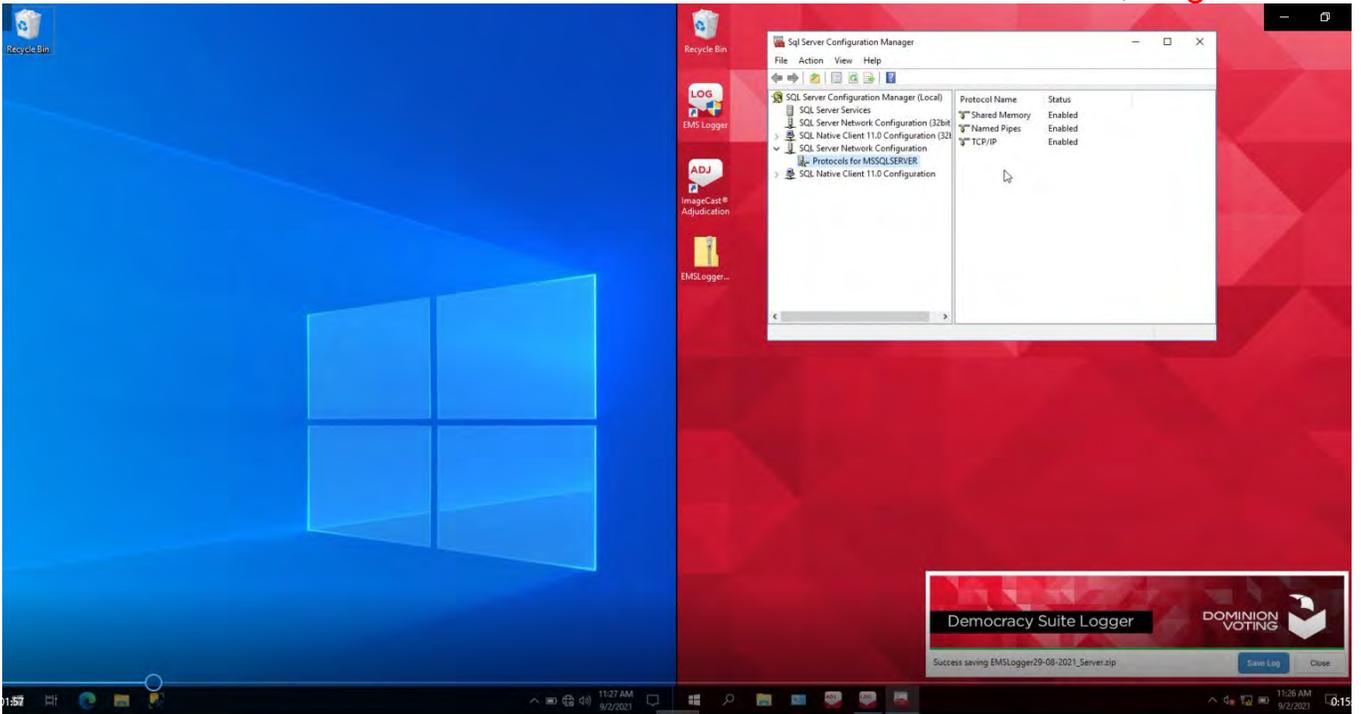

Figure 6 - SQL Server 2016 Configuration Manager – Network Protocols enabled

> All three of three possible SQL server protocols were left "Enabled," providing pathways to the database above what are required for operation. These extra pathways can severely reduce system security.

Under the SQL Server "Network Configuration" the menu item is selected titled "Protocols for MSSQLSERVER" that shows that more protocols are enabled than should be, especially for a "secure" system. While one of these may be necessary, all three being enabled presents an unwarranted risk.

Protocol Name	Status
Shared Memory	Enabled
Named Pipes	Enabled
TCP/IP	Enabled

Microsoft states, in its SQL server documentation[61] that:

"To enhance security, SQL Server disables network connectivity for some new installations. Network connectivity using TCP/IP is not disabled if you are using the Enterprise, Standard, Evaluation, or Workgroup

---

[61] https://docs.microsoft.com/en-us/sql/database-engine/configure-windows/default-sql-server-network-protocol-configuration?view=sql-server-ver15

27

edition, or if a previous installation of SQL Server is present. For all installations, shared memory protocol is enabled to allow local connections to the server."

For an election management system, it is entirely inappropriate and irresponsible to enable Shared Memory or TCP/IP access over an unsecured network connection, and particularly careless and irresponsible to enable these together with "Named Pipes." Shared Memory access permits an intruder to install malicious software and to execute arbitrary commands with full administrative privileges if exploited. Given the exceptionally minimal protection implemented on this server, if any connection were made to a network that provides a path to the Internet[62] by the EMS system, any other computer connected to the Ethernet network would be granted access to the TCP/IP ports[63] enabled by the EMS server and a hostile party would be able to penetrate and alter the EMS server.[64] In the examined state of the EMS server, if this network *or any computer connected to this network* were connected to the internet either directly or indirectly, by wire or wireless, a hostile party *anywhere in the world* would be able to penetrate and alter the EMS server, including altering actual election records, like tabulated vote databases.

A computer system configured in this manner should never be used in any critical infrastructure or high security environment and, as a voting system, should be immediately decertified and those responsible for creating and selling such system investigated.

While multiple security mechanisms exist within a Microsoft Windows 2016 server, including the Microsoft Windows Defender firewall, SQL database permission restrictions, Operating System security Policy, Group Security Policy, file access control lists, and much more,[65] some were configured not to protect the server but instead to allow all "local" and "remote" access. Tests conducted in this examination demonstrate that not only are those explicit programmed settings misconfigured, but that no other security mechanisms within the installed hardware and software prevented the ability to access and change election data, or even to provide any warning of such drastic and consequential access.

---

[62] Given the exceptionally large number of wireless devices in this election infrastructure (thirty-six), particularly in the context of the plethora of improper security configuration mistakes made in this installation, examination of every device in the infrastructure including the wireless printer must be undertaken before the network can be considered secure; absent appropriate systems log data, such a determination might not be possible.

[63] TCP/IP networks identify computer systems by their IP (Internet Protocol) address. TCP/IP further identifies the specific service (email, file transfer, database access, etc.) to be used on the destination computer using a port number transmitted within the beginning of the packet (in its header). Standards identify the assignment of port numbers to specific services, for example, web browsing uses port 80, encrypted web brmwsing uses port 443, email uses port 25, and database access using the Structured Query Language (SQL) uses port 1433. There are 65,536 available port numbers. Ports 0 through 1,023 are assigned to commonly used services/protocols, 1,024 through 49,151 are sometimes registered to a specific service, and those remaining are available for dynamic use (e.g., as needed). One can conceptually think of these ports in the same way we think of channels on cable TV – each is associated with specific content.

[64] For example, see CVE 2018-8273, CVE 2021-1656, CVE 2020-0618 at http://cve.mitre.org and Microsoft Knowledgebase KB 4073225 regarding the "Meltdown" and "Spectre" vulnerabilities presented by the "management engine" back door in every CPU manufactured since 2007 whether Intel, AMD or ARM processors.

[65] See the US Department of Defense Security Technology Implementation Guides (STIGs), at http://public.cyber.mil

There is a great misunderstanding about intrusion into computer systems. Many people conceive of it as depicted by Hollywood, where an intrusion takes several minutes or significantly longer. While this makes for good drama, it is not realistic at all. In the real world, malicious actors – particularly hostile nation-states, e.g., China, Russia, North Korea and Iran to name a few, have extremely sophisticated cyberwar capabilities. They are capable of intruding and *altering data* in a matter of less than a few seconds and they engage in persistent cyber operations to penetrate and compromise supply chain, industrial base, trusted vendors, academia, and government offices which might someday afford access.

Intrusion can be accomplished without a direct connection to the target computer. In the case of a voting system, using the example of an Adjudication Workstation connected via wired Ethernet to the EMS, if the Adjudication workstation has a wireless (Wi-Fi) interface, such a connection might be automatically connected to external devices and networks without the EMS or Adjudication workstation operator ever noticing it, especially since all laptops today have both wired Ethernet and Wi-Fi interfaces which might enable an Island-Hopping attack. Thirty-six (36) wireless devices were identified in the Mesa County DVS D-Suite system (e.g., on the DVS D-Suite ICVA computers and ICX tablets and one Dell E310DW wireless printer, with IP address 192.168.100.11, set as the default printer on the EMS server). Any other connected device, including a printer like the one installed on the Mesa EMS infrastructure,[66] creates an increase in this risk exposure. This is why an Internet connection in any device or computer, even several connections removed, is so extremely dangerous to critical systems. To mitigate this risk, the US Department of Defense (DoD) maintains special closed networks for sensitive information, which are forbidden to have internet connections or connection to any system with an internet connection.

Appendix D lists some of the more notable nation-state cyber-attacks as well as a link to an online video of one cyberattack that completely destroyed a power generation facility. Adversaries constantly scan and probe every computer on the internet, and through those computers, other devices and computers not directly connected to the internet, to identify weakness well in advance of the need for an attack. Today's attacks occur very quickly, in a matter of seconds.

---

[66] At Bell Laboratories in the 1980's, printers that used the Postscript language were exploited (to leverage their computational power) in this manner because they were the first to have a bi-directional communication connection (e.g., able to talk back to the host computer, over a network). Today's printers all have this capability and present a risk of being a component of an Island-Hopping attack.
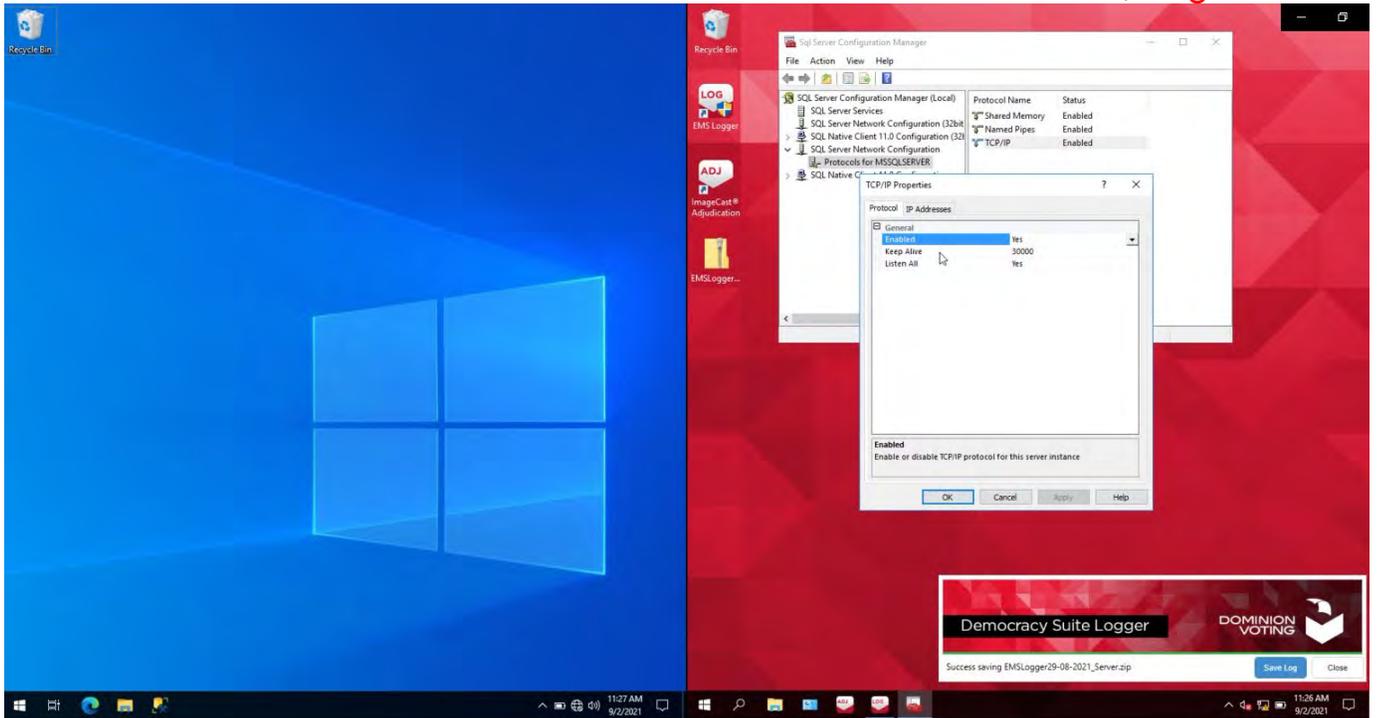

Figure 7 - TCP/IP Properties

> **The TCP/IP protocol setting in Figure 7 has "Enabled" set to "Yes" on Mesa County's EMS Server, and the configuration setting above has the parameter "Listen All" set to "yes" indicating that the SQL Server will listen on every network connection. More detail for the TCP/IP protocol is in Figure 8.**
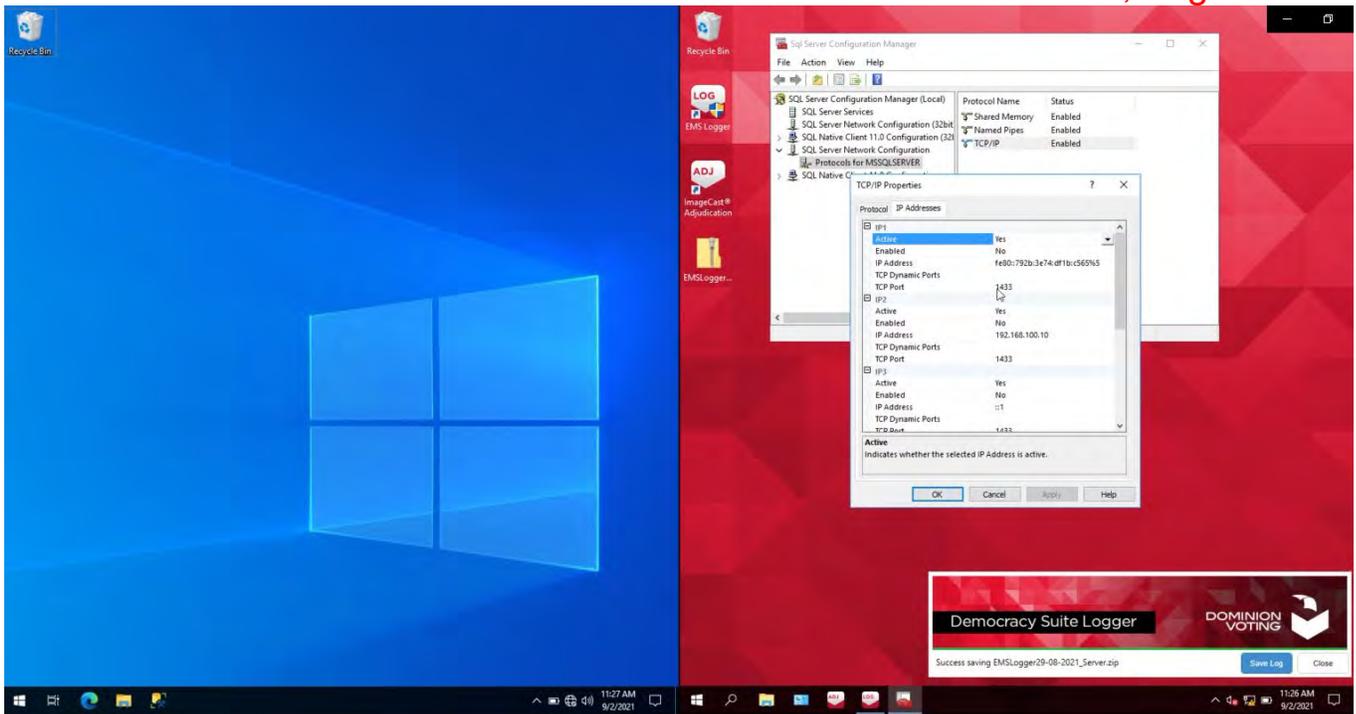

Figure 8 - TCP/IP Properties of SQL Server, attached to port 1433 the standard (default) port.

> **Figure 8 shows the SQL server is bound to and active on all Ethernet interfaces. This allows multiple electronic pathways to the server over multiple network connections should someone connect a cable into that jack. Also important to note is the default port number 1433 being used, instead of a more secure alternate port.**

IP2 shows the IPv4 address 192.168.100.10, an IP address assigned to be used by the Mesa County EMS server. For a discussion of IP addressing fundamentals, see Appendix C. IP Addressing Fundamentals.

The Mesa County EMS server is a Dell PowerEdge T630 server, serial number 4NV1V52, and has 3 Ethernet interfaces (or Network Interface Cards (NICs)) – 2 of them assigned to the computer itself and one assigned to a separate controller (the iDRAC, Integrated Dell Remote Access Controller) which can be used to allow remote control of the computer including power-on, power-off and privileged access to the computer, via this integrated remote access controller (iDRAC). The interfaces accessed via the Server Configuration Manager (shown in these Figures) are those IP addresses assigned to the computer and do not include the interface assigned to the iDRAC.

A conclusive determination that these IP addresses had a connection to another network, even the Internet, is not possible without examining the physical system, as well every other device connected to the network. Most network firewall/router devices use translation (network address translation, NAT, or port address translation, PAT) and most computers/devices with multiple network interfaces (Wi-Fi, and wired Ethernet, for example) can be compromised to implement an Island-Hopping attack (using malicious software that provides translation, even though standards may prohibit it).

Absent a full forensic examination of all network and computing devices, it can be challenging to factually conclude that connection to the global Internet was, or was not, present and in operation. Given that network systems are designed to support Internet connectivity, other evidence (including the alteration,

addition or exclusion of votes, or data in log files, for example – See Report #1) must be considered, may be the only artifacts that enable detection or conclusive determination, and may indicate a probability that such a connection may have been in use.

I was told that when this exact copy (forensic image) of the Mesa County EMS server was taken, the Mesa County EMS server was connected to a (wired) computer network via its Ethernet interface. Configuration data forensically extracted from the EMS server, including some log remnants and registry configuration data validate this information about the connection to a network.
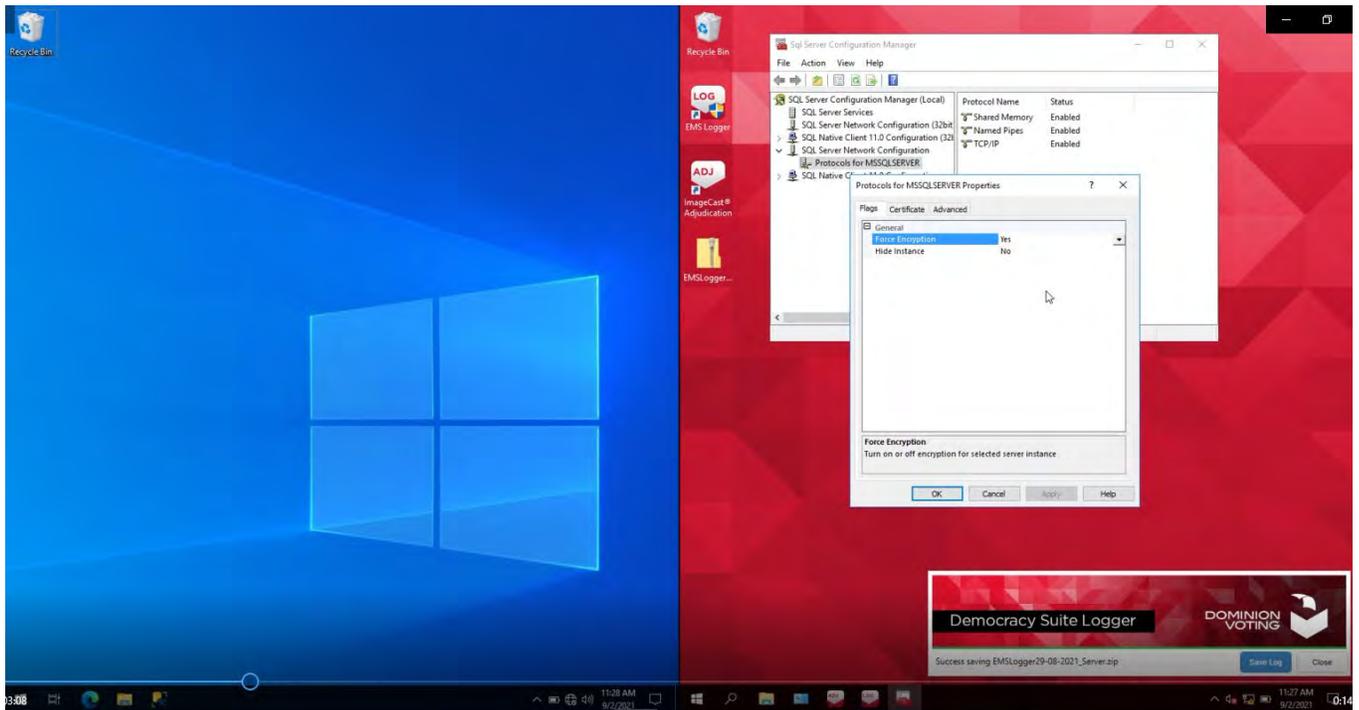

Figure 9 - SQL Server Properties

> **The SQL Server service is configured to force network communication to be encrypted. This is an expected configuration; however, it is crippled by what was found next.**
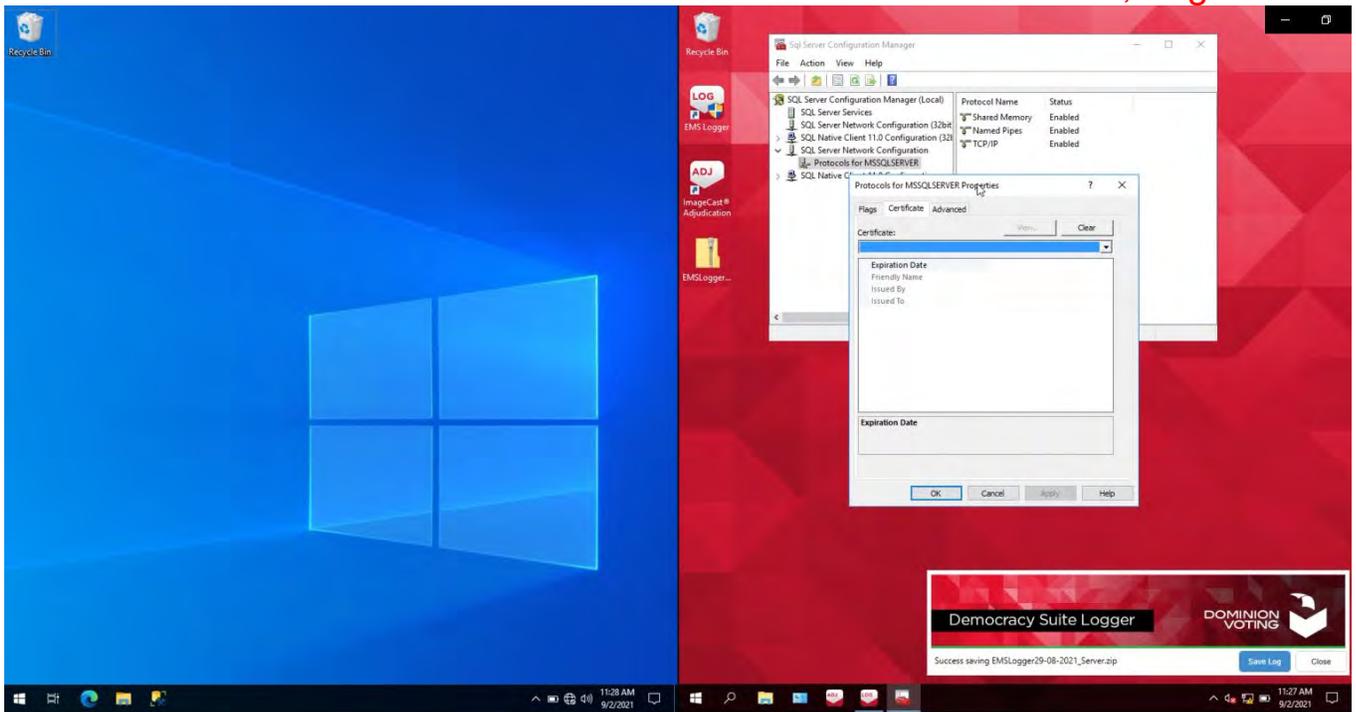

Figure 10 - Encryption is enabled but No Encryption Certificate is configured

> **No encryption certificate is configured, which causes the server to use a 'self-signed' certificate that is extremely vulnerable to a common man-in-the-middle attack. This means that the communication to and from the voting database itself could be intercepted, viewed, and changed, without detection.**

A man-in-the-middle attack is explained in Appendix H.

The SQL Server Documentation directly provided by Microsoft clearly states "Self-signed certificates do not guarantee security. The encrypted handshake is based on NT LAN Manager (NTLM). It is highly recommended that you provision a verifiable certificate on SQL Server for secure connectivity. Transport Security Layer (TLS) can be made secure only with certificate validation." (https://docs.microsoft.com/en-us/sql/relational-databases/native-client/features/using-encryption-without-validation?view=sql-server-2016)

EXAMINATION OBJECTIVE 1:

Determine whether calculated vote totals can be altered by anyone with physical access to the logged-in EMS server.
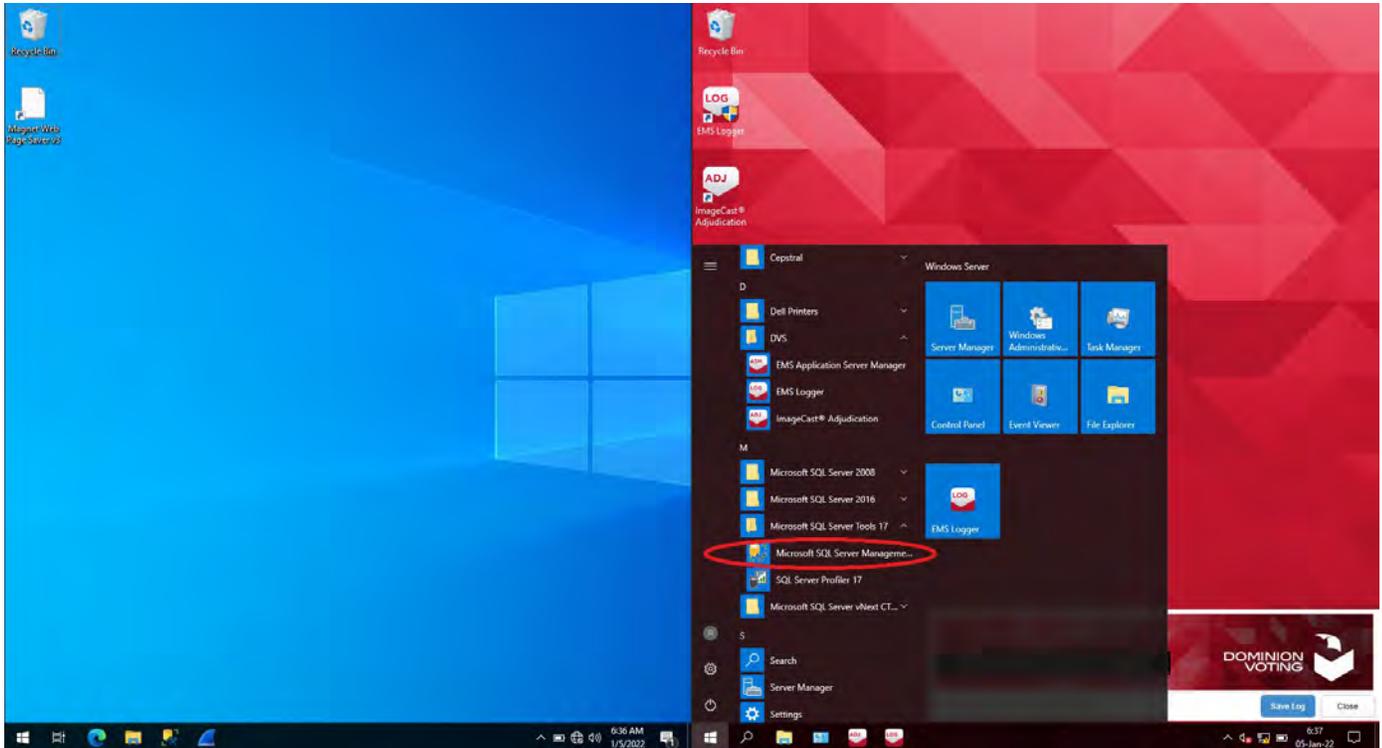

Figure 11 - SQL Server Management Studio (SSMS) software showing in the EMS server Start Menu

---

Microsoft SQL Server Management Studio (SSMS) allows direct back-end access to and manipulation of SQL Server databases. Figure 12 shows this software is found already installed on the EMS Server.

The VSS explicitly prohibits voting systems from allowing any users to change calculated vote totals, or an individual vote, or to compromise ballot security; the VSS also mandates the retention of all audit trails for 22 months specifically to enable detection of civil rights violations or intentional manipulation and fraud, and to support litigation and prosecution. SSMS enables that prohibited ability, as demonstrated in this test.

The Mesa County EMS was protected by only a (Windows authentication) password, as this test demonstrates. The use of a password alone is not secure; this fact is taught routinely in training for the board certification "Certified Internet Systems Security Professional" (CISSP), emphasizing the principle of "Defense in Depth," e.g., multiple layers of security.

Passwords are compromised often.[67] As early as 1985, the US Government published, in its "rainbow series" of security publications from the DoD, the "Green book[68]" guide to password management. While the password management recommendations in the guide are considered obsolete today, its appendices explain the mathematical calculation for the probability that a password can be guessed based on the complexity of the password, how often the password is changed, and the speed with which a computer can execute those guesses. Today's computer processor execution speed (CPU clock rate) is 5,000 times faster than computers were in 1985. Today's gaming home computers are 5 times faster than the fastest computer in the world was in 1985,[69] and systems used for crypto-mining may be as much as 100 times faster than that fastest 1985 computer.

Password insecurity alone presents an extreme and unacceptable risk.
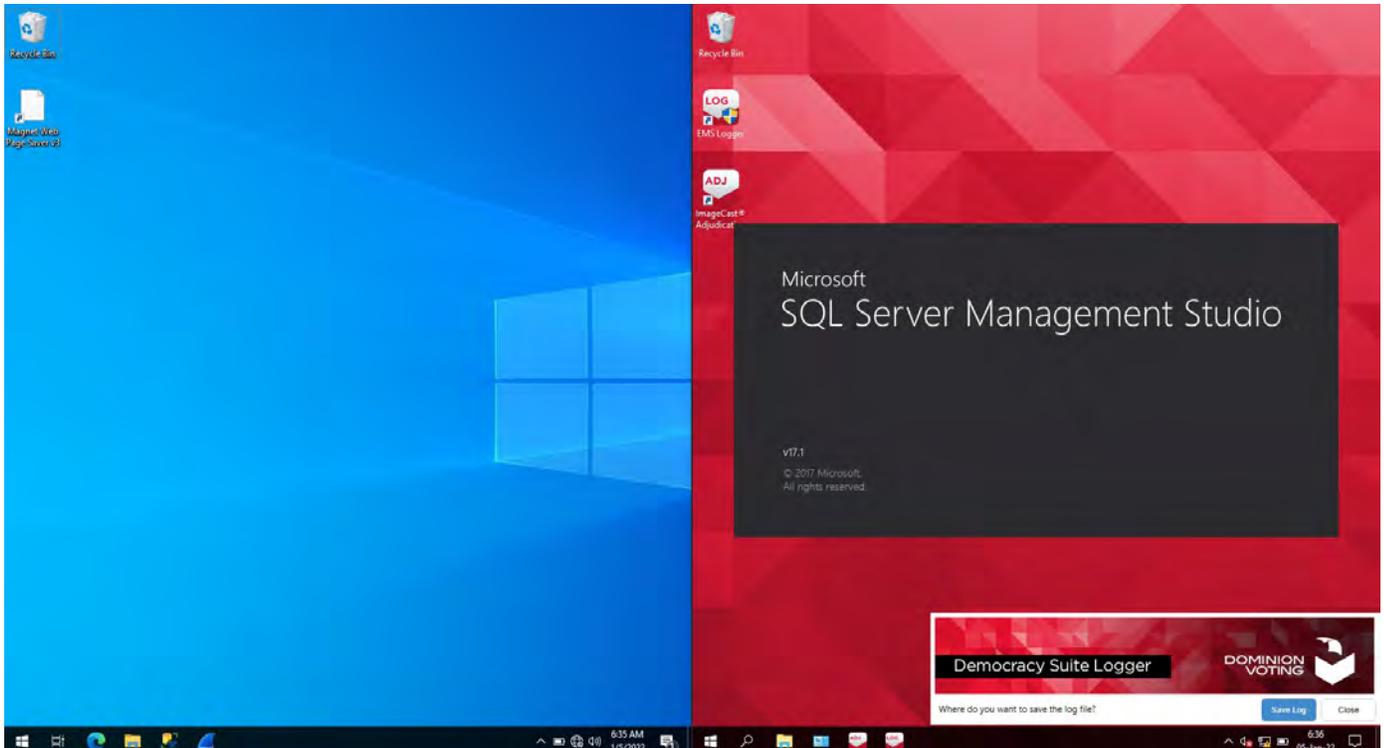

Figure 12 - SSMS is installed and starting on the EMS server system.

The SSMS starts up without any problem or warning when a user clicks on it.

---

[67] Accounts in public media support this fact. These are only several of many such references: https://www.westernjournal.com/az-audit-exclusive-election-systems-password-hasnt-changed-2-years-shared-time/ and https://www.csoonline.com/article/3266607/1-4b-stolen-passwords-are-free-for-the-taking-what-we-know-now.html
[68] https://csrc.nist.gov/CSRC/media/Publications/white-paper/1985/12/26/dod-rainbow-series/final/documents/std002.txt
[69] A Cray X/MP supercomputer operated at a clock speed of 1 GHz, or 1 billion clock cycles per second in 1985, while the first home PC clock speed was typically 1MHz.

Not only can SSMS be used on a separate computer, not part of the DVS system, to directly access the back-end server databases, it can be used directly by any person with physical access to the logged in server itself (screen, keyboard, and mouse), such as rogue election staff, cleaning staff, etc.

In addition to bad-actors from outside the election staff, any individual election staff worker that has access to a logged-in EMS server also is allowed the ability to go directly into the back-end of the database and add votes, change votes, delete votes, swap votes, and countless other alterations, bypassing all DVS application software. Even an honest individual could accidentally allow data to be changed without their knowledge in a matter of seconds by innocently attaching a USB flash drive with hidden programming/malware on it.

Anyone with unrestricted physical access and knowledge of the userID can make similar changes without even a password, if the standard user account is left logged-in. Someone with advanced security knowledge can access the system without a password, as I was easily able to do.

In this test the Microsoft SQL Server Management Studio is used to demonstrate unauthorized access to the election databases. However, the use of Microsoft SSMS is not even required – a popular piece of software manufactured by SQL Pro (e.g., non-Microsoft software) is shown in the third test in this report, to provide the same access from the more limited computing power of a mobile phone.
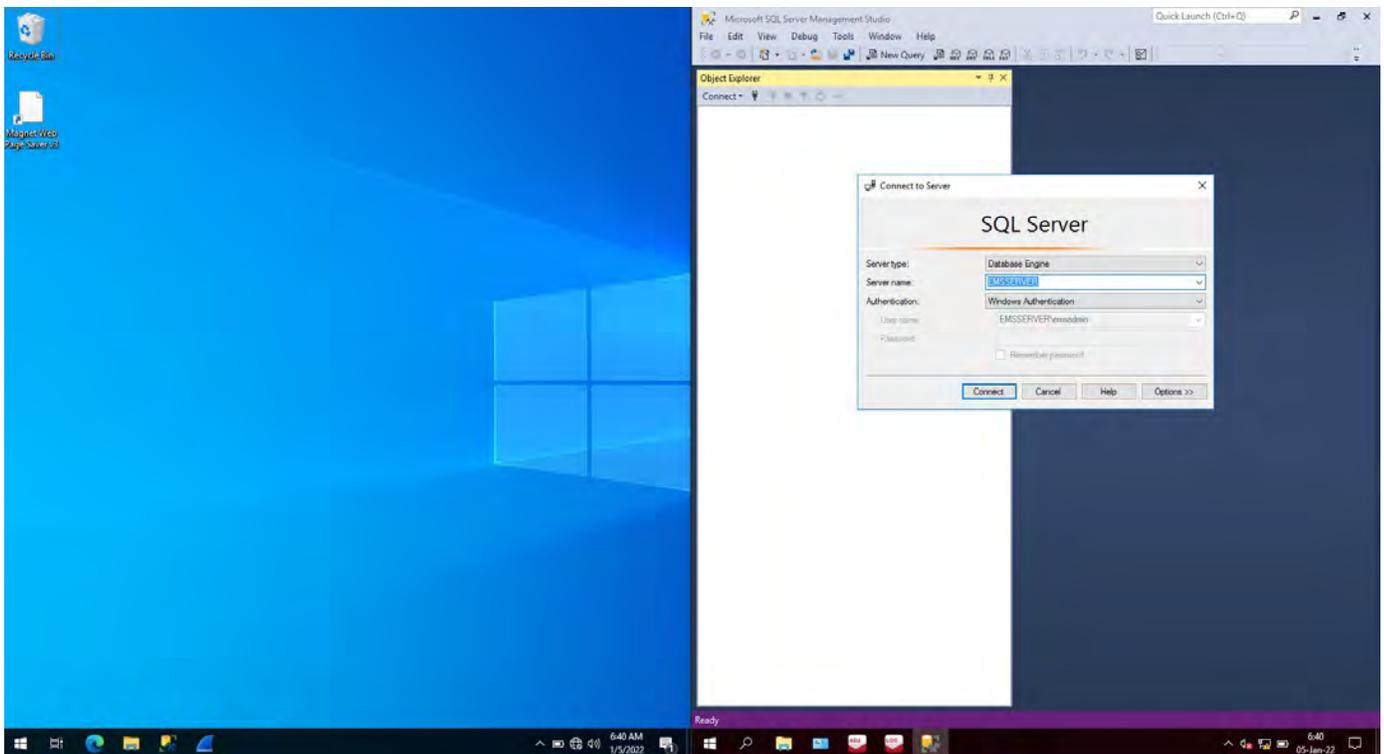

Figure 13 - Logging in to the SQL Server using SQL Server Management Studio

> **When SQL Server Management Studio (SSMS) first starts, connection entries are already pre-filled-out. The user doesn't isn't required to type a username or password, and needs only to click the 'Connect' button to get into the back-end databases.**
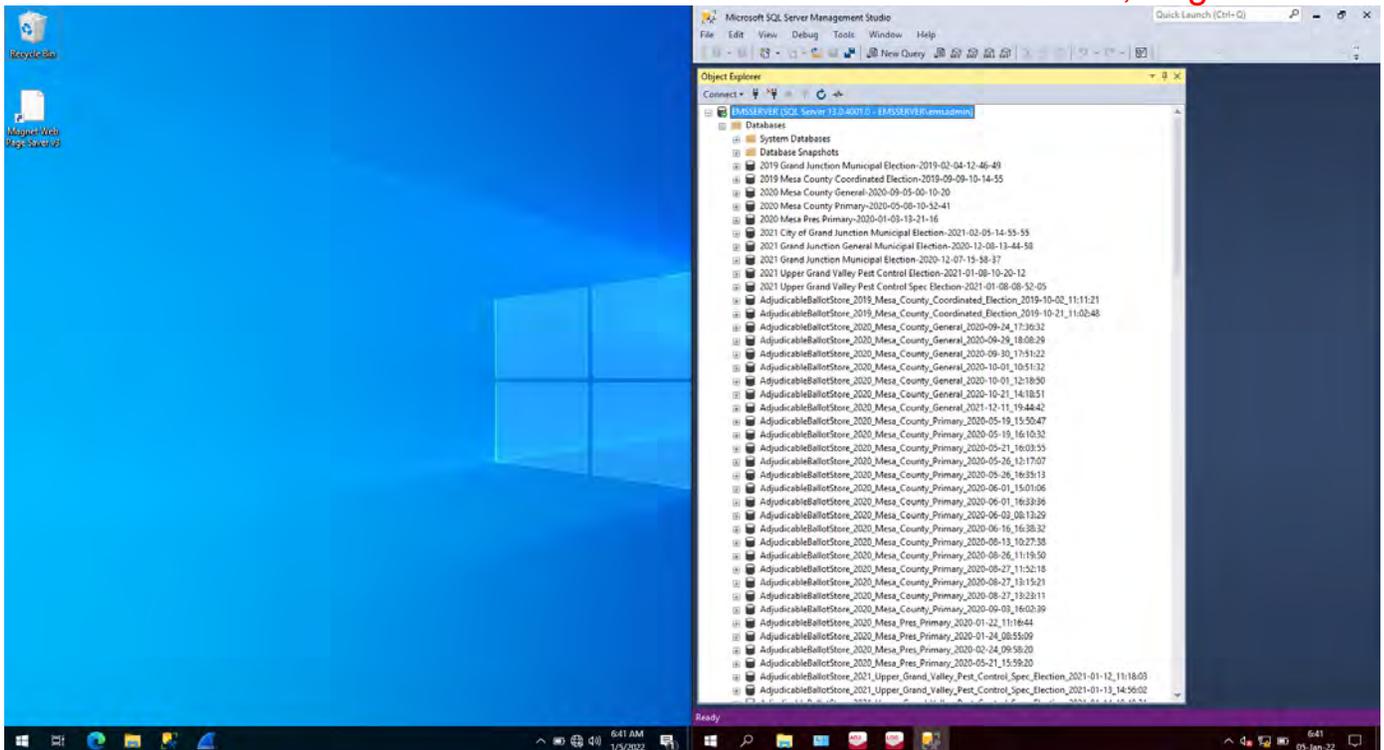

Figure 14 - SSMS enables direct access to the internal databases to anyone logged in to the EMS server

> **After clicking 'Connect,' and then the '+' sign next to 'Databases' all the internal databases are shown to be accessible. It took only four clicks of the mouse to get here into the back-end of the voting databases.**

One of the many election databases that are shown is from the 2020 US General Election. The US Presidential Primary of 2020, among many others, can also be seen.
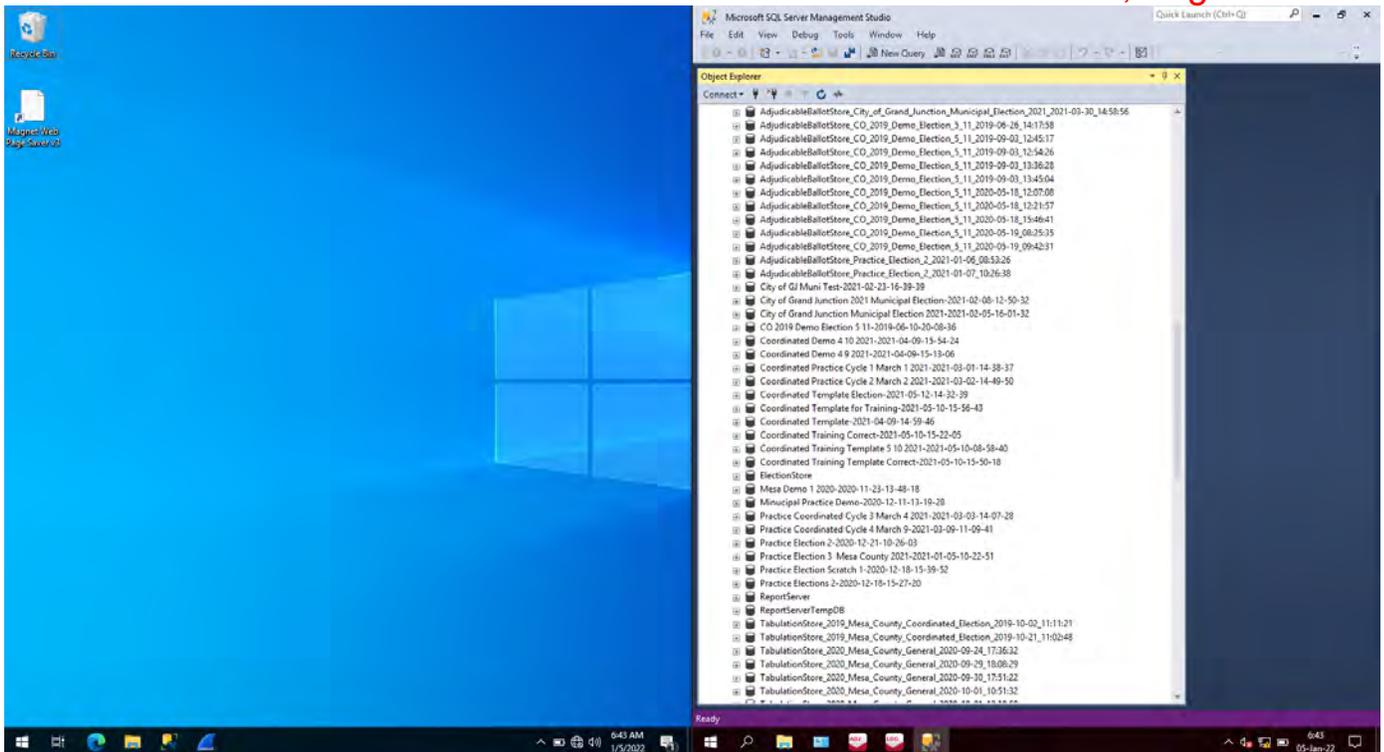

Figure 15 - Databases from many prior elections are fully accessible

> **Here can be seen accessible many elections from the City of Grand Junction, Mesa County, as well as <u>adjudication</u> and <u>tabulation</u> databases from many of these elections.**

The presence of databases from previous elections on the EMS server, provide a rich library of information that can be used to understand and identify potential vulnerabilities in the EMS. While these records are required to be retained, they should be maintained off- system, securely archived, inaccessible to the EMS or any user.

The presence of prior election databases on the EMS server also offers an extensive and convenient repository for copy and paste modifications of election data, not only for the 2020 election but for any prior listed election as well.
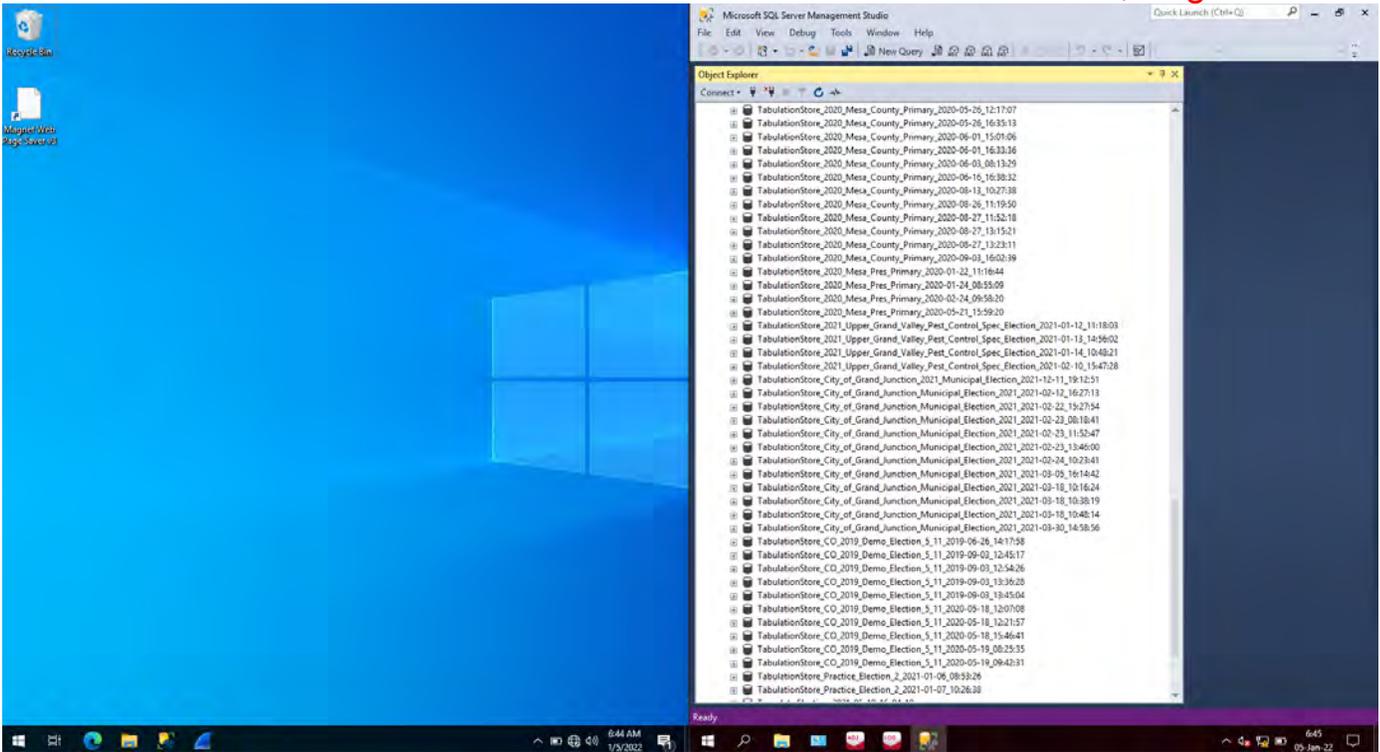

Figure 16 - Additional databases used in previous elections

> **Many TabulationStore databases are shown here, including even a TabulationStore for the Upper Grand Valley Pest Control Special Election.**

Figure 16 is a continuation of the list in Figure 15, demonstrating that far more than one screen of databases are accessible.
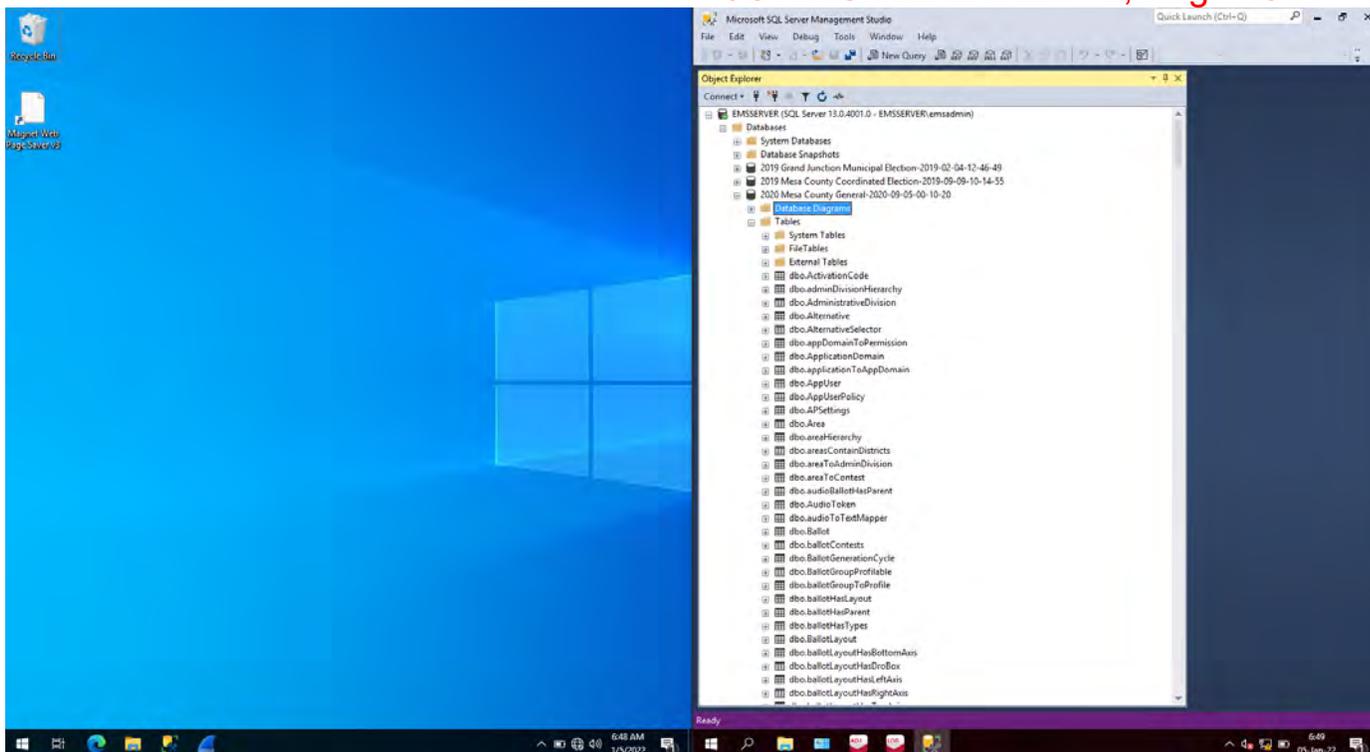

Figure 17 - Internal database tables, including ones with counted votes are accessible

> The '+' sign next to the <u>2020 Mesa County General</u> database was selected, followed by the '+' sign next to 'Tables.' A list of all internal database tables for the 2020 Mesa County General database is now shown. Nothing has stopped me from accessing this. Not a single warning has shown on screen.
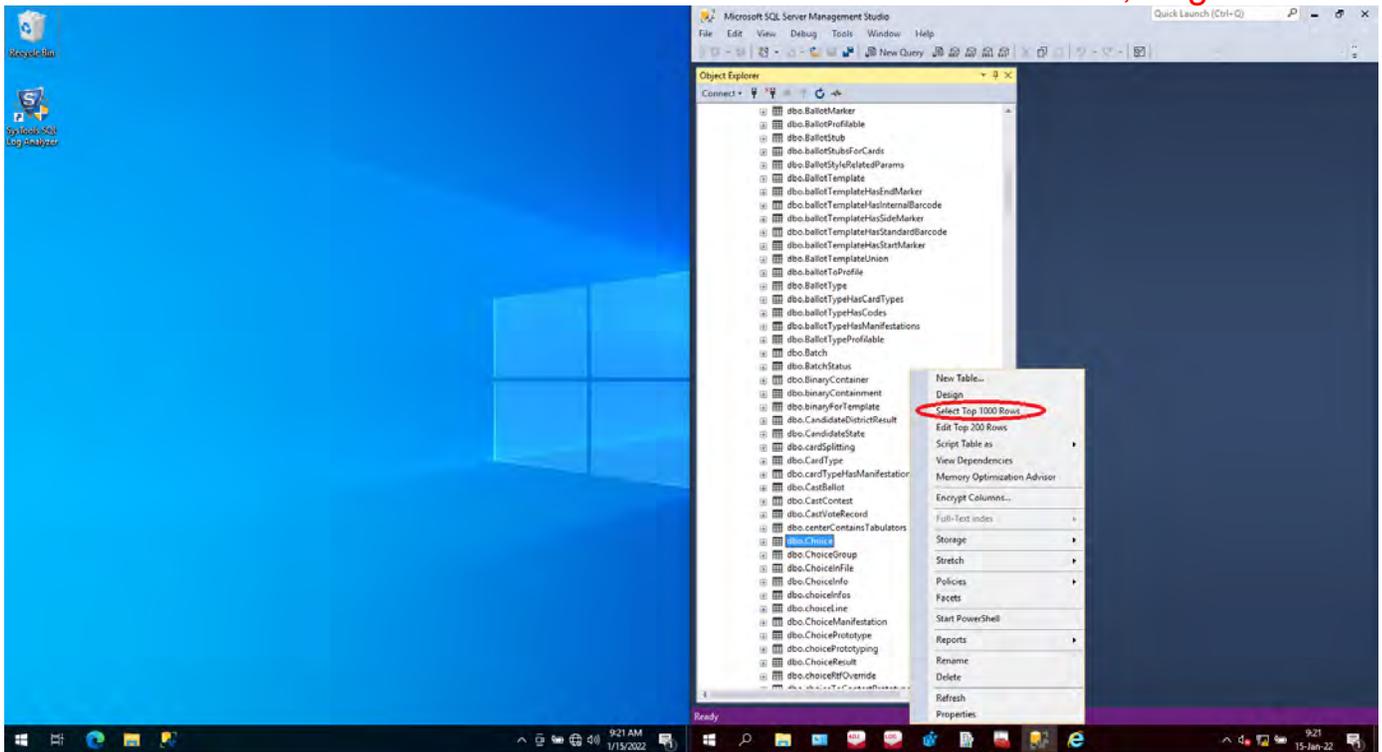

Figure 18 - Menu Option to Select the Top 1000 rows

As an example, one of the tables, 'dbo.Choice,' was selected by scrolling down and right-clicking, then choosing 'Select Top 1000 Rows' by clicking on that option. This instructs the database server to show me the top 1000 rows in the database table.
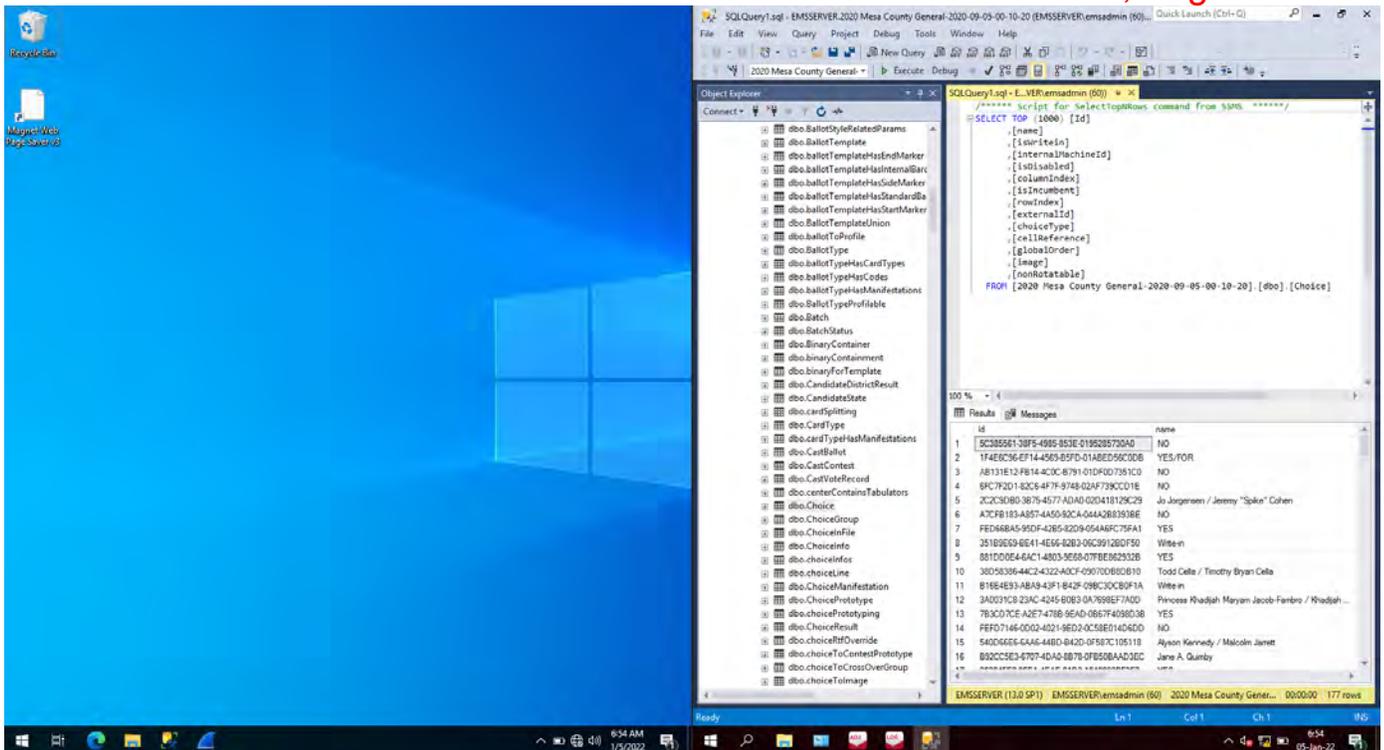

Figure 19 - Accessing the Ballot Choice database table

> I was able to easily open the Ballot Choice database table. The computer retrieved all 177 rows of data from this table in the database. This corresponds to 177 different ballot choices in the election. I have still not been blocked, nor has the system provided any warning that anyone is directly accessing the voting database.

Each election "contest" is defined, together with candidates and the rules for voting, e.g., "pick one, pick two, pick three, etc.," depending on the specific item, for example, commissioners of a town, and the number of seats open in this specific election.

On the right side of the screen in the upper right pane is displayed the SQL Query (SQL program script) that is automatically filled-out by SSMS. The user merely just needs to know how to click the mouse button. The automated query shown is used to retrieve data (the top 1000 rows), and the data columns listed that will be retrieved are also shown. On the bottom right pane the response from the request is shown. The first two columns display on screen ('Id' and 'name') but the scroll bar allows one to scroll to the right to see the remaining 12 columns.
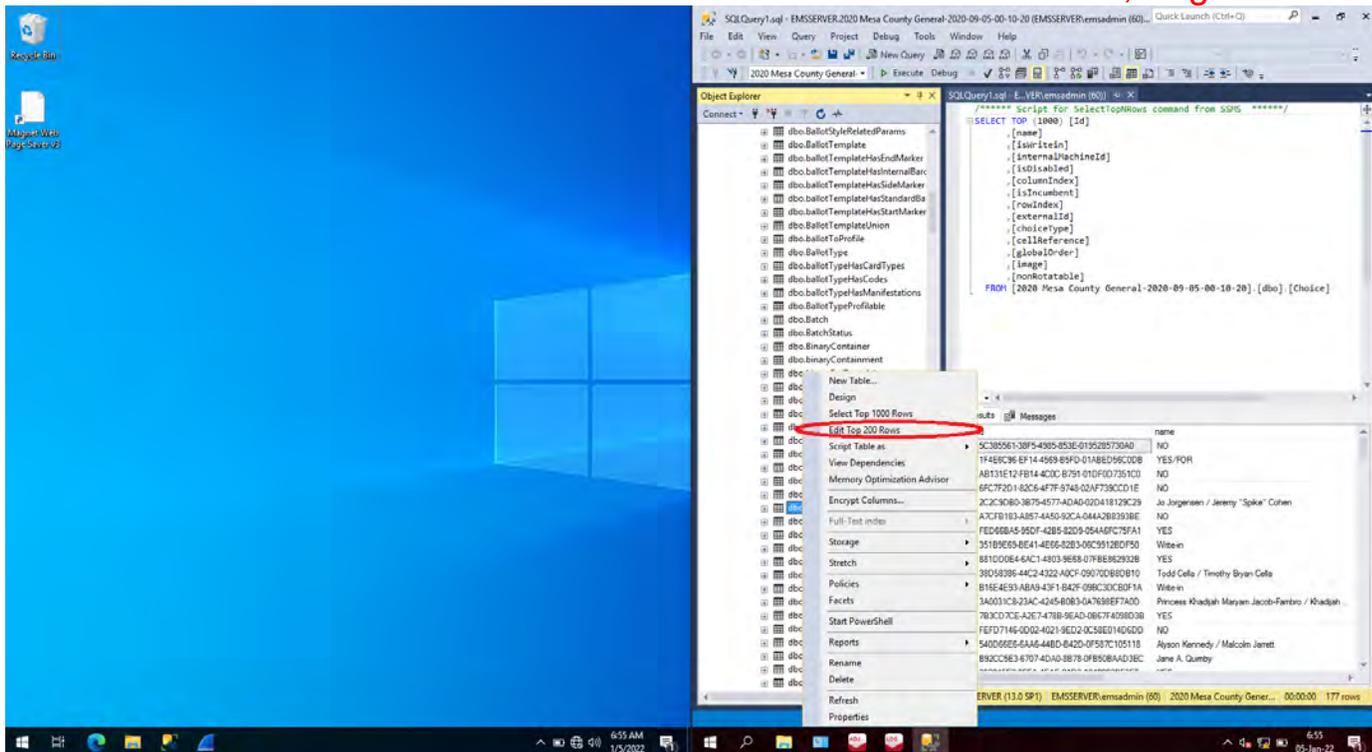

Figure 20 - Test to determine if the Ballot Choice Table can be edited to easily flip the votes

I now right-click the table again and select the menu option to Edit the Top 200 rows of the database to determine if it will also allow me to directly alter the data.

Figure 21 - Candidate settings for Trump

> **The computer responds to the request and shows all 177 rows of this Choice table in a spreadsheet-like display. Note here that the Choice 'Donald J. Trump / Michael R. Pence' has an internalMachineId of '2'.**

Note the first four columns are:

- Id – A unique identifier to identify the particular choice.
- Name – The 'title' of the choice on the ballot.
- isWritein – Possibly used to signify if a particular choice is a write-in field.
- internalMachineId – Another unique identifier to identify a particular choice used to produce reports.

The internalMachineId parameter is an indirect reference to the counted vote for candidates. Because the reference is indirect (i.e., a number rather than a key index that is common to the candidate's identity throughout the database), the reference can be easily changed, flipping the vote, and is extraordinarily difficult to identify. In database design, this is an example of bad design practice that breaks the "referential integrity" of the database and enables the potentially malicious action demonstrated here.
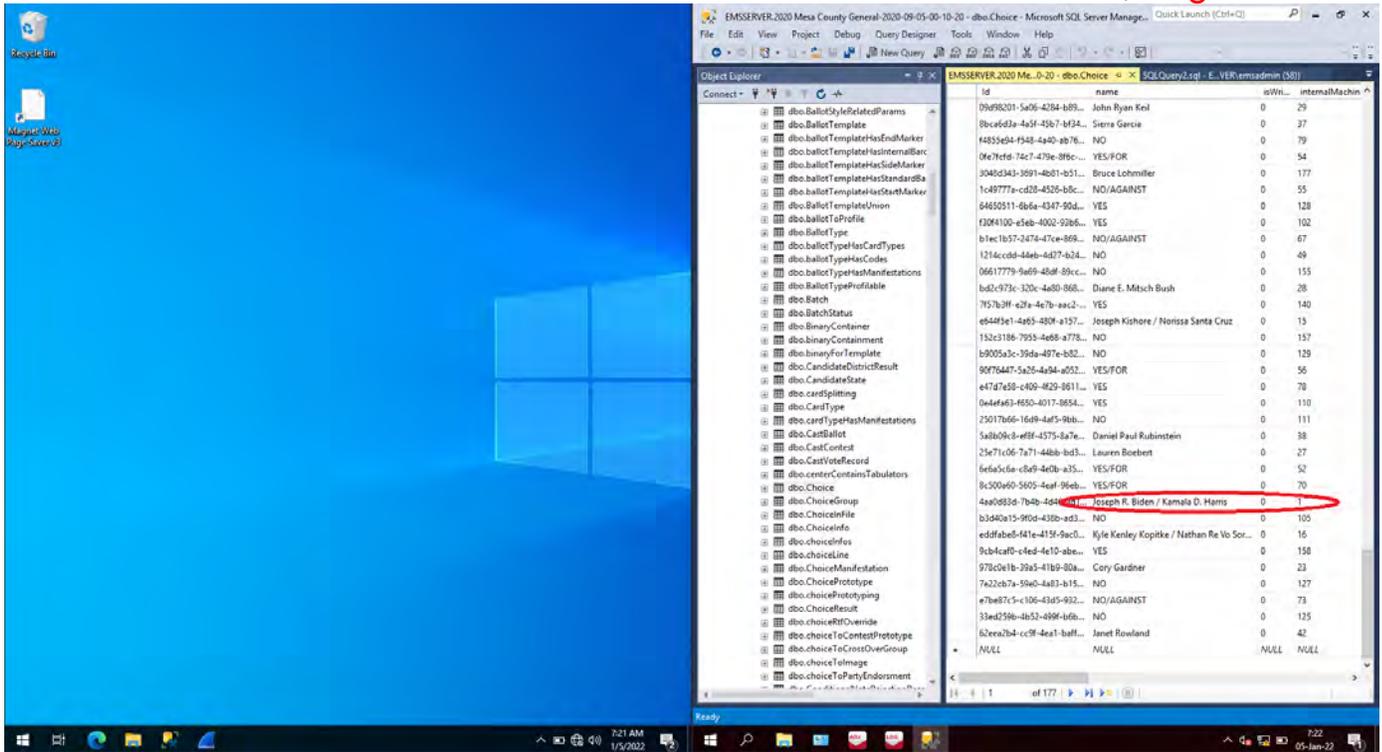

Figure 22 - Candidate settings for Biden

The 'Joseph R. Biden / Kamala D. Harris' choice has an internalMachineId of '1.'
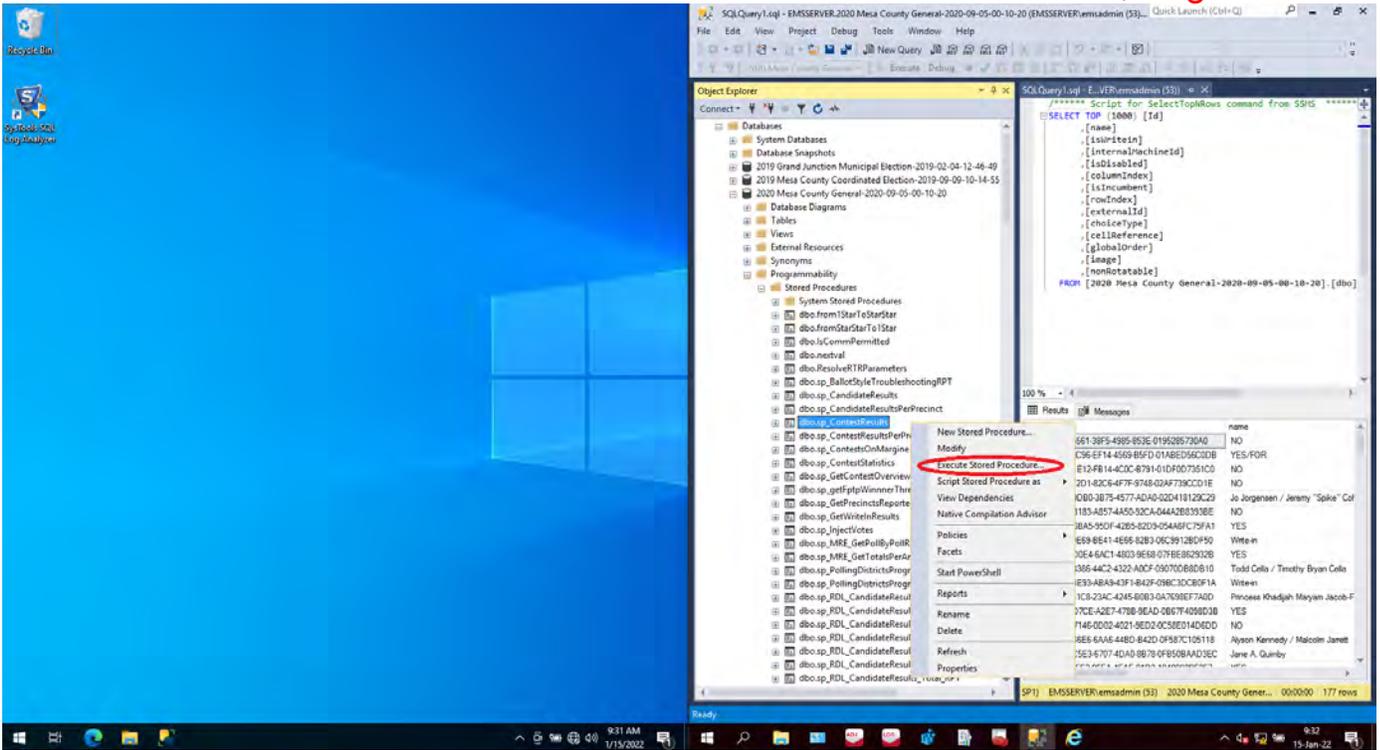

Figure 23 - Pulling up the results report prior to attempting the alteration

Prior to attempting to make a direct change that would alter the results of the election, the Stored Procedure 'dbo.sp_ContestResults' is executed to query the current contest results. These steps involve only a few clicks of the mouse.
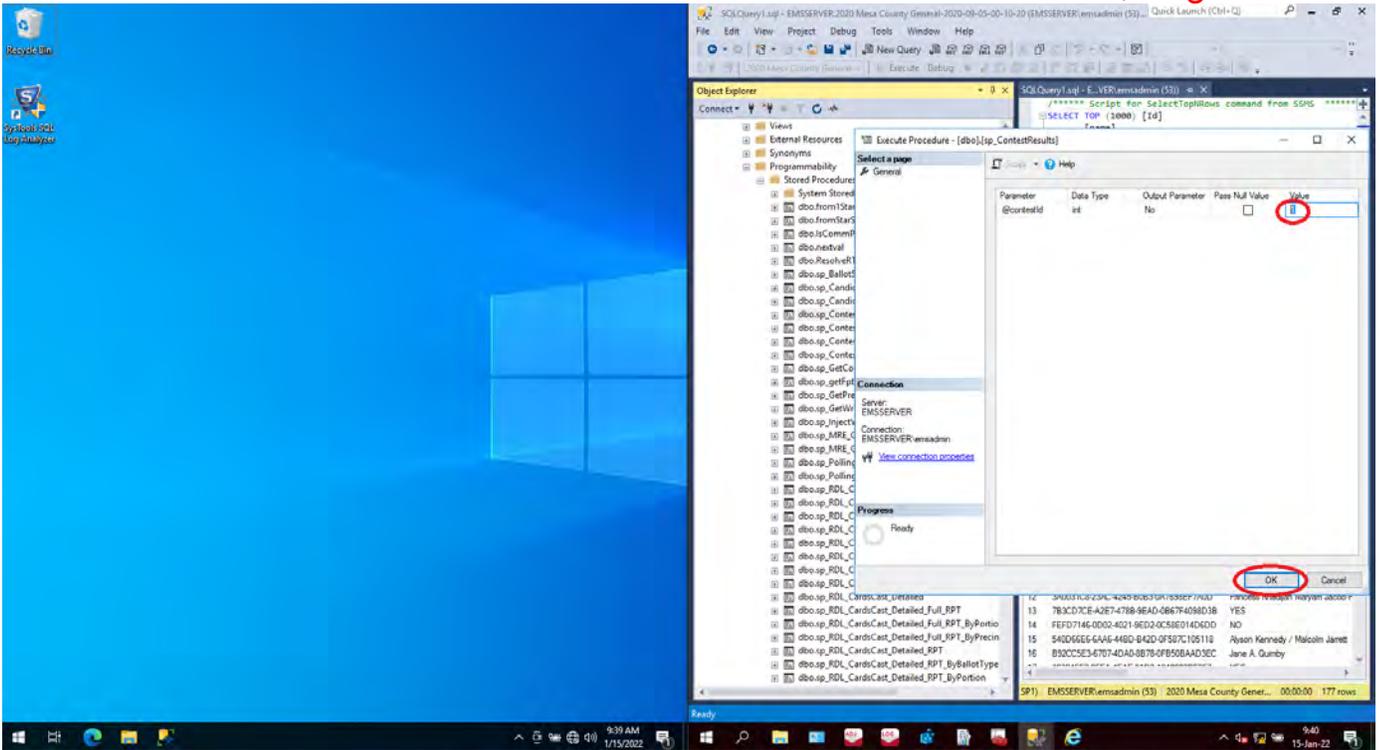

Figure 24 - Run Stored Procedure to pull up a report of Presidential Electors

The computer then prompts for which ContestId to query. A '1' to signify the Presidential Electors is entered, then 'OK' is clicked.
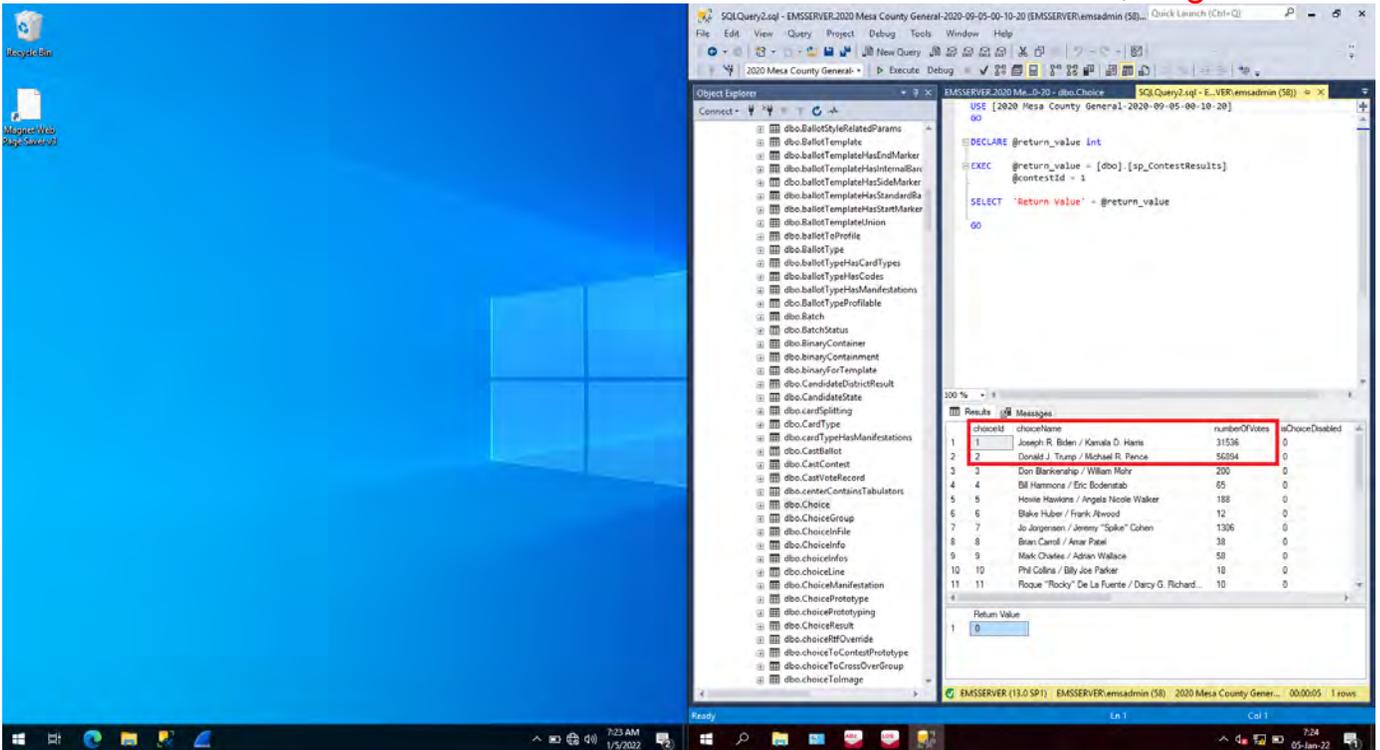

Figure 25 - Retrieved Vote Totals

This report shows the total number of votes for the Presidential contest:

'Joseph R. Biden / Kamala D. Harris' as having 31,536 votes, and

'Donald J. Trump / Michael R. Pence' as having 56,894 votes.
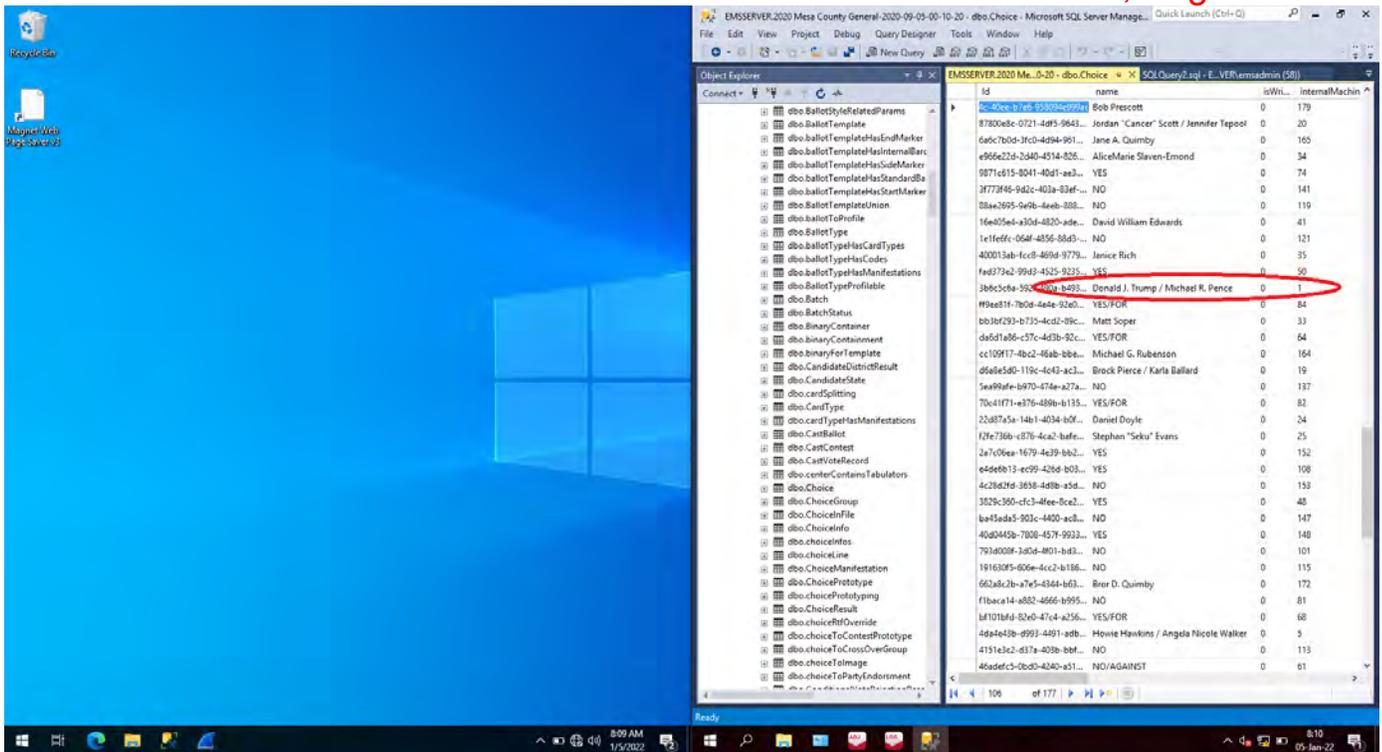

Figure 26 - Candidate number for Trump modified

Here, I change the Trump 'internalMachineId' from a '2' to a '1.' The SQL Server Management Studio allows the change without any hesitation or warning that a crucial piece of data was changed. The lack of good design and very poor referential integrity allows this.
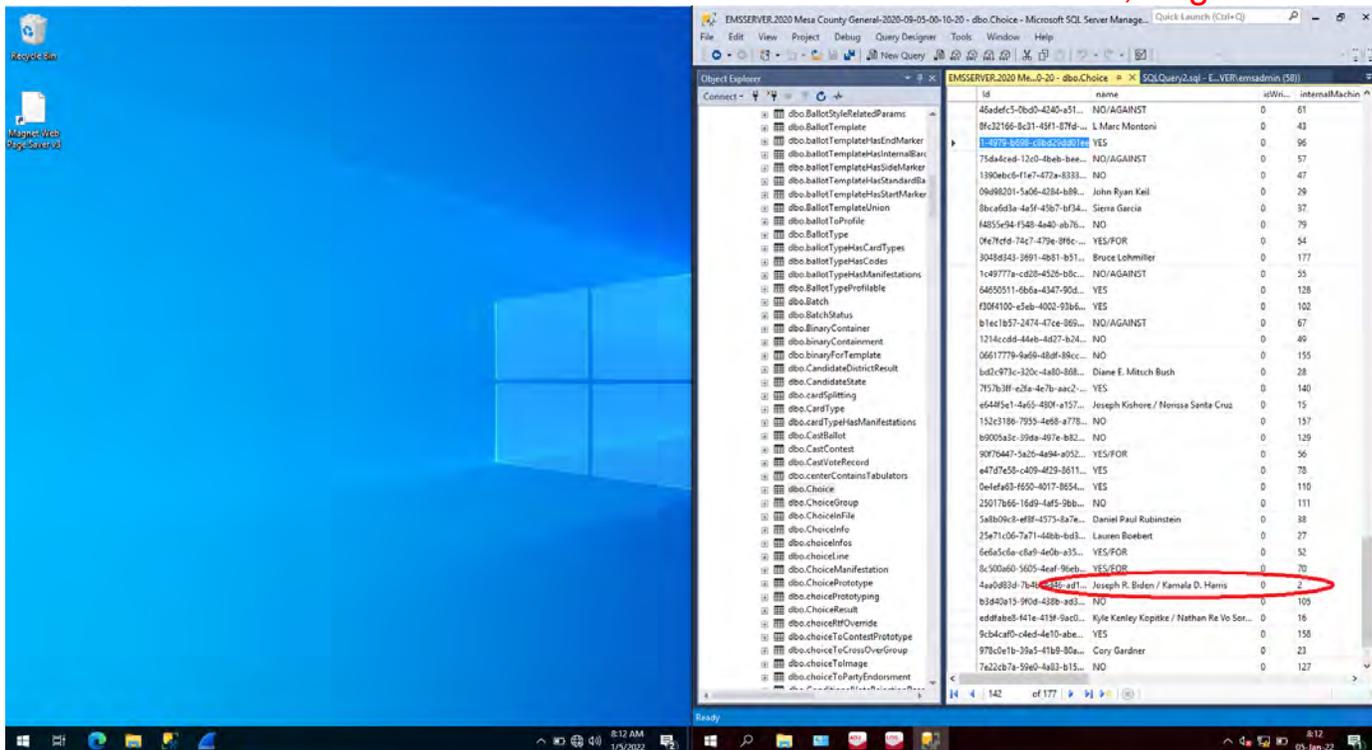

Figure 27 - Candidate number for Biden modified

> **Next, I change the Biden 'internalMachineId' from a '1' to a '2.' Again, there is no error message or warning given by the system.**
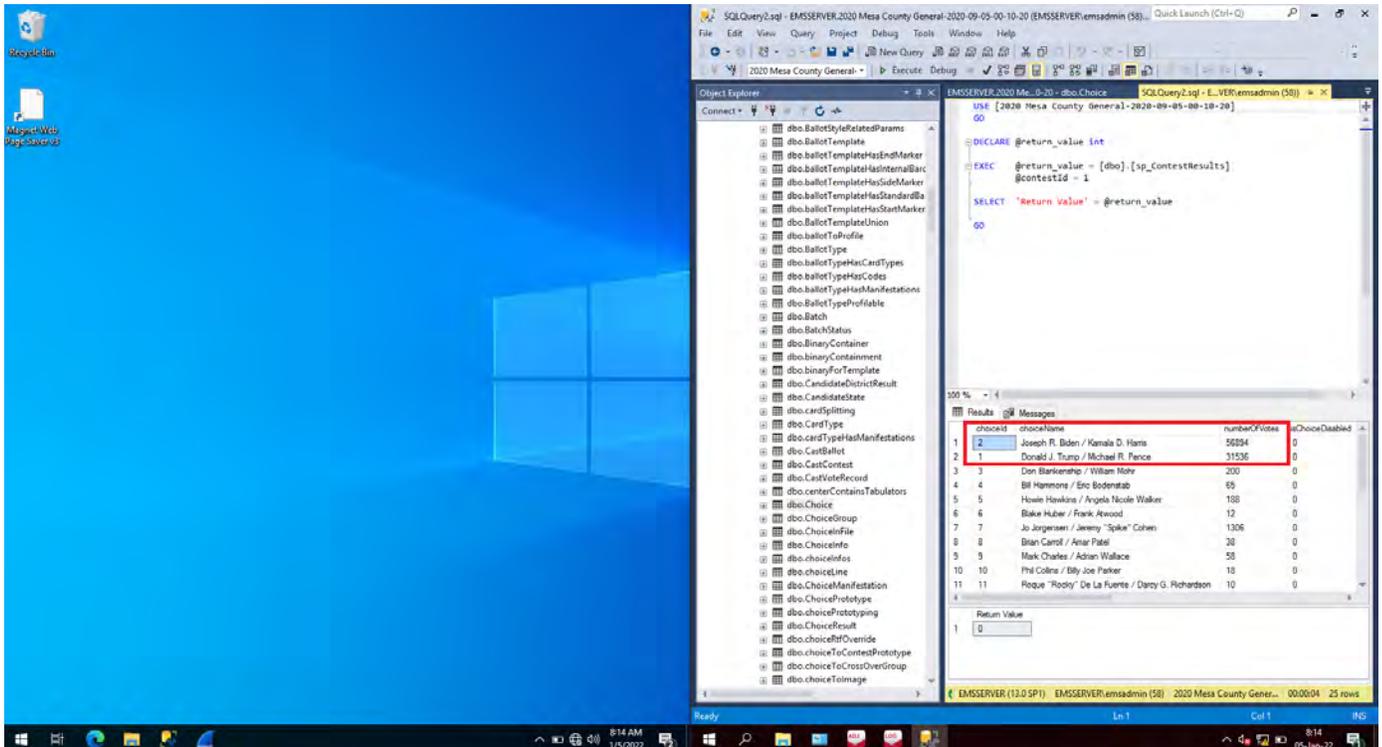

Figure 28 - Vote totals retrieved again after modification.

> **Making only these two small changes, which can be done in under a minute by an individual sitting in front of the voting system server, resulted in a flip of 25,358 votes. This demonstrates the ease with which someone can <u>completely alter the results of the election</u> on this EMS server with only a few mouse clicks and 2 keypresses on the keyboard with the software that is built-in to this voting system. This is only one in countless ways election data could be altered.**

When the stored procedure is executed to retrieve the vote totals again, the vote totals for Biden now show 56,894 and the total for Trump shows 31,536.

By changing only two values in the election database in less than a minute, I have flipped 25,358 votes, completely changing the vote total results in the election database. The change was made using Microsoft SSMS software already residing on the EMS server, without needing to enter any additional password, and without a warning about the risk of changing this information.

> **Finding 2: The existence and use of unauthorized and uncertified Microsoft SQL Server Management Studio (found on the EMS server in Mesa Co. and in other counties around the country), allows and facilitates the bypass of Dominion Voting Systems' software to alter calculated vote totals in the election database by anyone with physical access to the logged-in EMS server.**

51

It is important to understand how easily this was done, and therefore how quickly such a change can be made. It was not necessary to change the 88,430 votes in the database, but rather only two index values, the internalMachineId values, to completely flip the result of this county's votes.

> **Finding 3: It is a simple task to flip votes and therefore very easy to do quickly.**

> **Finding 4: The insecurity of the Mesa County EMS server, in concert with unauthorized, uncertified software, allowed the alteration of the election result, flipping the vote from one candidate to another, with trivial difficulty.**

Let us also distinguish the claim being made here:

It is not asserted in these findings that this 'Vote Flipping' was performed on this server during the 2020 election, but rather the design and configuration of the system permits it, and due to the extraordinary lack of security and the unauthorized, uncertified software installed on the system, the voting system itself was, and is, completely uncertifiable and wholly unsafe to use for any election.

To be explicitly clear, this demonstration is about the lack of security and the access that insecurity and unauthorized software allows, and it is explicitly not about the vote totals in any election from this server. The lack of efficient logging and the destruction of the required log files prevent any assertion to the contrary in this analysis.

Whether votes were 'flipped' using this process, or the countless other ways that could be used, requires examination of computer system logs and database logs, and other data, and will be separately addressed. In this finding, it is demonstrated that it is possible, and that the defects in the security and certification of the system are extraordinary and far beyond simple errors and omissions.

> ## EXAMINATION RESULT 1
> **Vote totals can be altered by anyone with physical access to the logged-in EMS server.**

EXAMINATION OBJECTIVE 2:

Determine whether the calculated vote totals can be altered by any person using a non-Dominion computer directly or indirectly connected to the EMS server network.
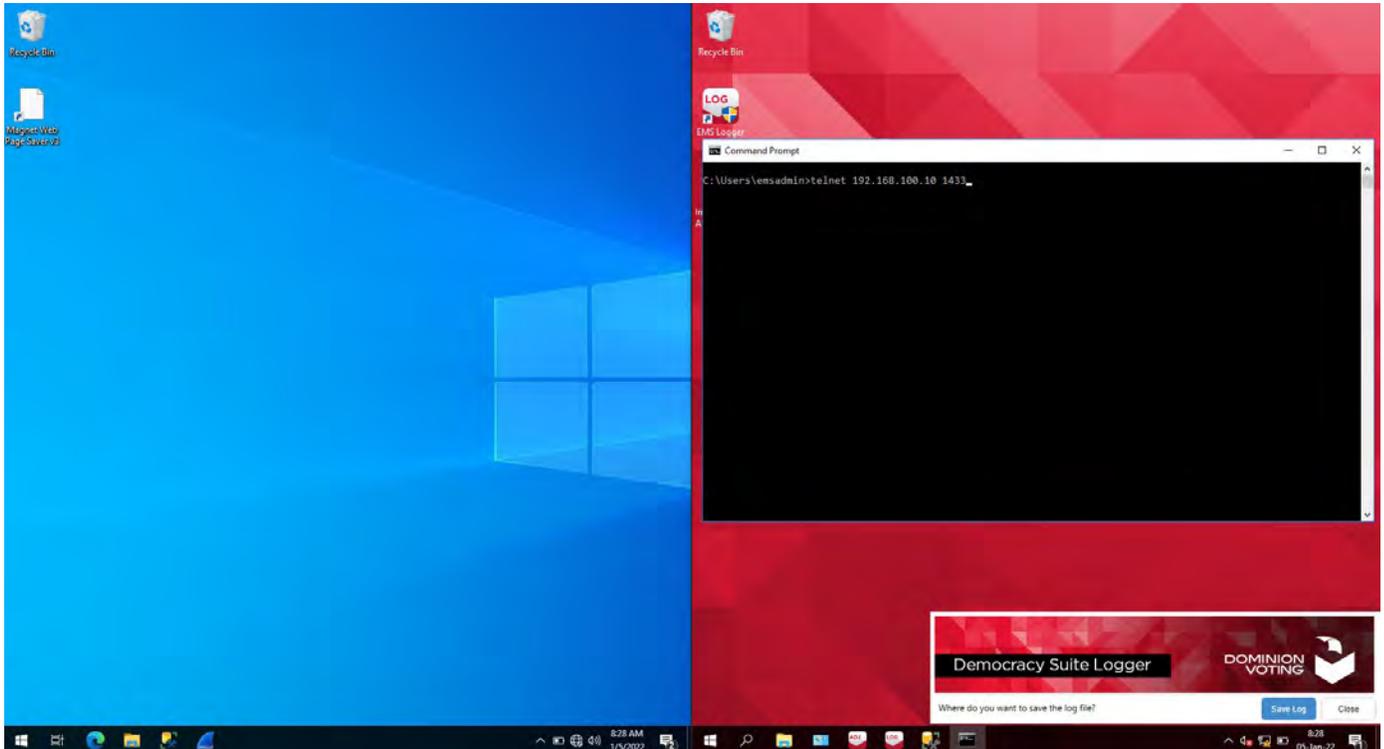

Figure 29 - Accessing port 1433 with Telnet

> **The telnet command is used to test to see if direct network connection to the database port is possible.**

'Telnet' is a common network diagnostic tool used by IT and Cybersecurity professionals for communicating with a telnet server, and other text-based TCP services.
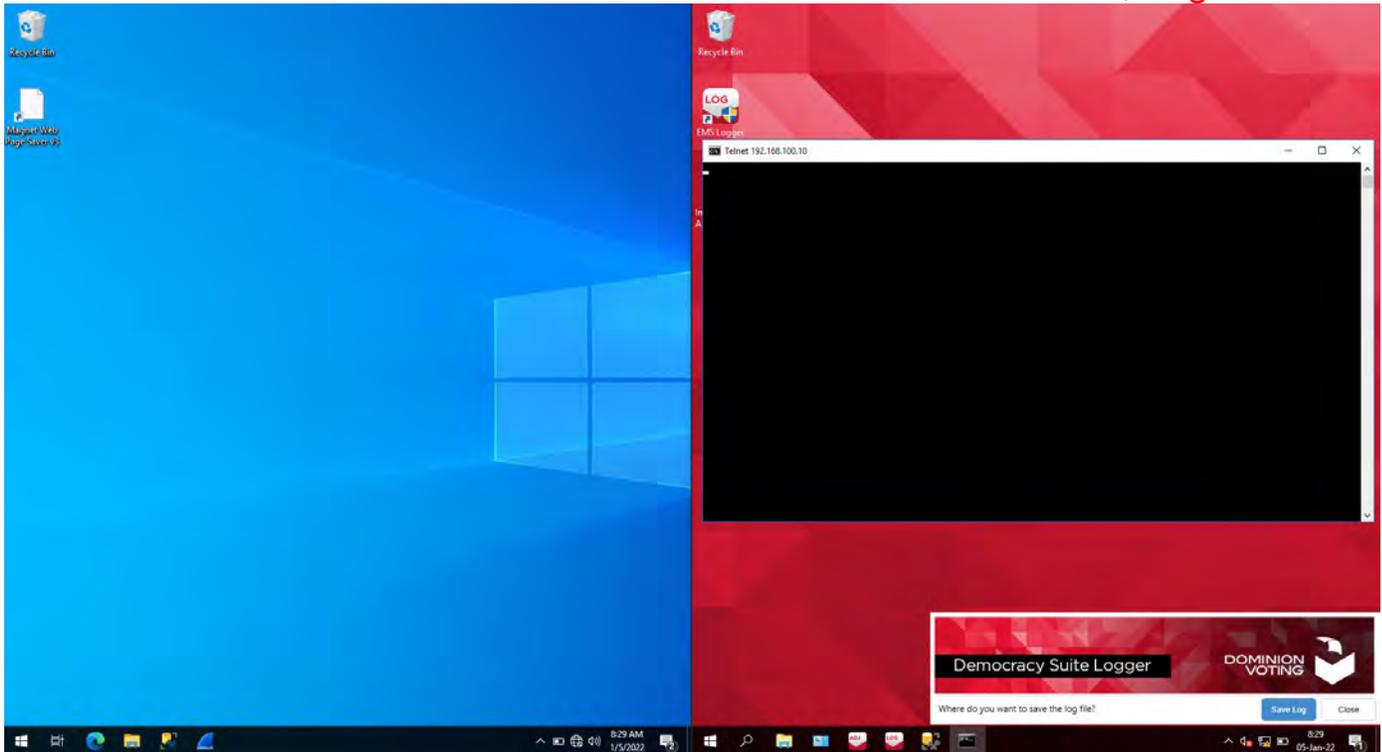

Figure 30 - The EMS server network interface appears to answer a connection to port 1433

The blank window with the cursor in the top left indicates that the connection was indeed successful, and the database service is now waiting for input.
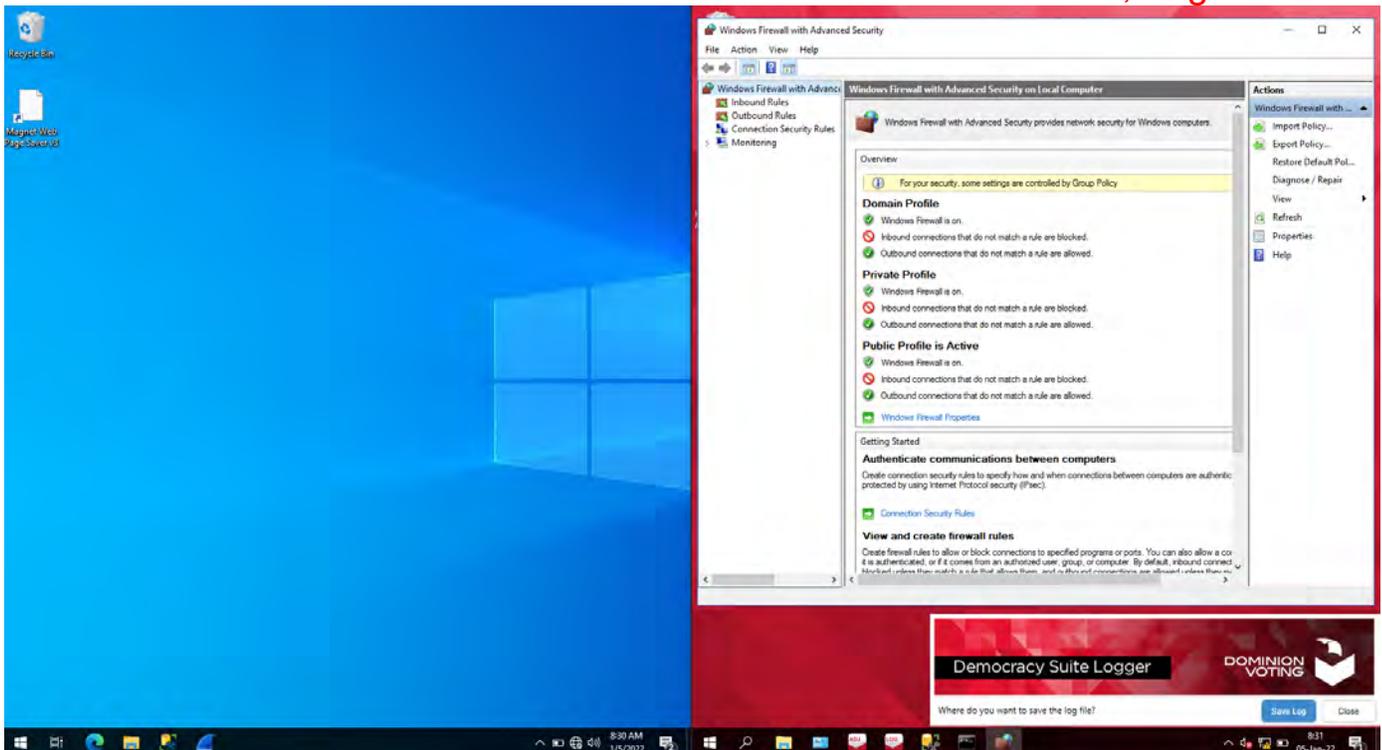

Figure 31 - EMS server has the 'Windows Firewall' enabled

Because it was trivial to connect directly to the database server on port 1433, the firewall was then checked to see if it was enabled on the server. This figure shows that the Windows Firewall with Advanced Security is installed and enabled, however the configuration of the firewall must now be examined to see why it allowed this activity.

The Mesa County EMS server contained firewall software, but it is the specific configuration of the firewall that is unsafe. In this screenshot, the firewall is shown to be enabled. For each profile ("Domain," "Private," and "Public"), the settings are the same:

- Windows Firewall is on. **<- GOOD**
- Inbound connections that do not match a rule are blocked **<- GOOD, but requires further inspection.**
- Outbound connections that do not match a rule are all allowed. **<- RECKLESS FOR A 'SECURE' SYSTEM**

Before going further, it is important to understand what a Firewall is and how it operates. A Firewall is a device that evaluates computer traffic on a network, and based on rules, allows or denies each specific connection. The rules in most common firewalls contain:

- the source IP address,
- source port number,
- Internet Protocol number,
- destination IP address,
- destination port number,

- (Some firewall rules may contain dates and times, for example Monday to Friday 8 am to 5 pm),
- the action to Allow the connection,
- Block the connection,
- Drop the connection, and
- whether to log the connection.

Typically, the rule base is evaluated from top to bottom in order, and the first rule that matches the connection is applied (and the rest of the rule base is skipped). For ANY connection that did not match previously – it is blocked by the Firewall.

It is notable that outbound connections that do not match a rule are set as "Allowed" in this EMS server. For a critical infrastructure voting system, such a configuration is completely reckless. Per VSS[70] and industry best practices systems that require connection should be explicitly specified, and no other outbound connections should be allowed. One of the reasons for such a requirement is that many internet addresses contain malicious software that can be downloaded and installed, sometimes automatically, depending on how they are accessed. The existence of such malicious software has given rise to an entire Anti-Virus and Anti-Malware industry.

---

[70] VSS Volume 1, sections 6.4 and 6.4.2
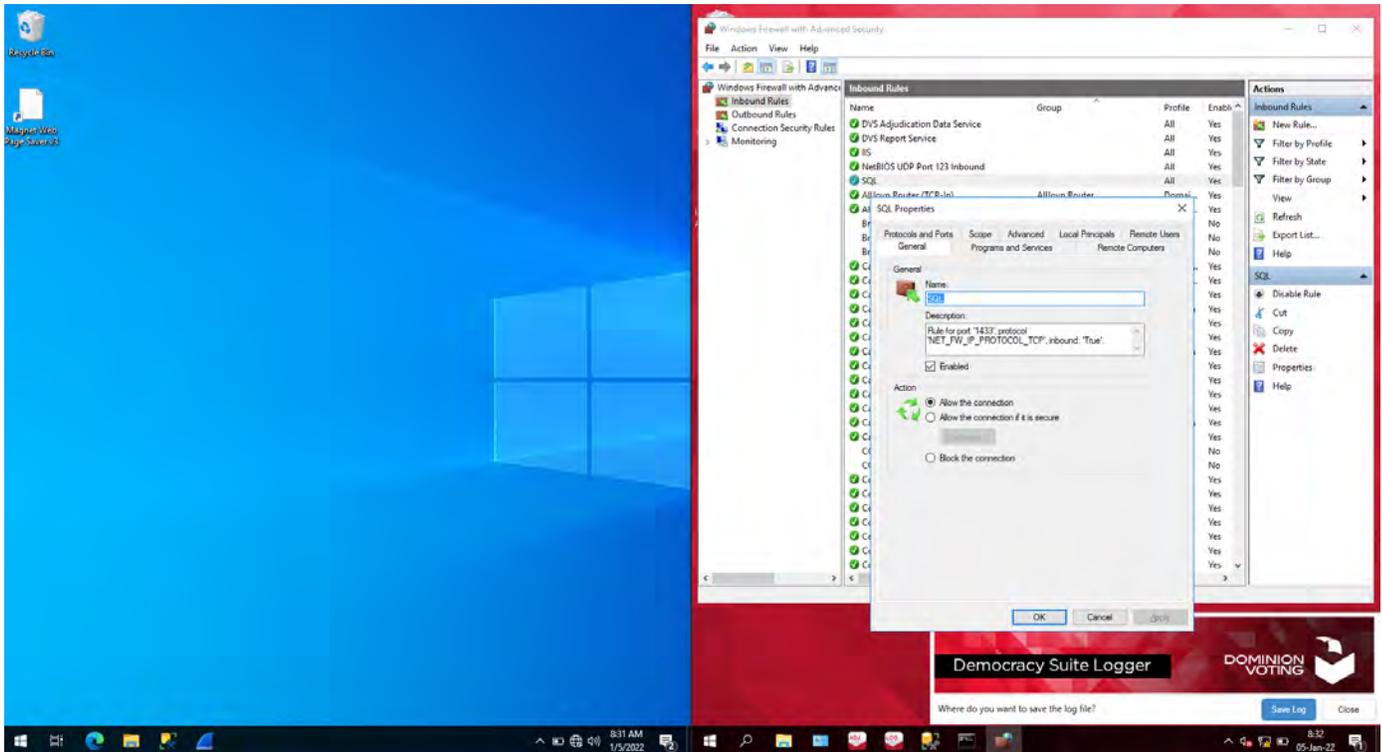

Figure 32 - Windows Firewall Custom SQL entry is enabled

Within the Windows Firewall, a custom firewall rule was found for the SQL service. This rule is not created by Microsoft; it must have been created by another means. The content of the 'SQL' rule is examined and shows the rule is "Enabled," and set to "Allow the connections". Note, the option titled 'Allow the connection if it is secure' just below the chosen option is available however not selected. This means again, the vendor had the option and opportunity to make the system configuration more secure, and neglected to or chose not to, and the individuals involved in the certification either did not check or ignored the vulnerability.
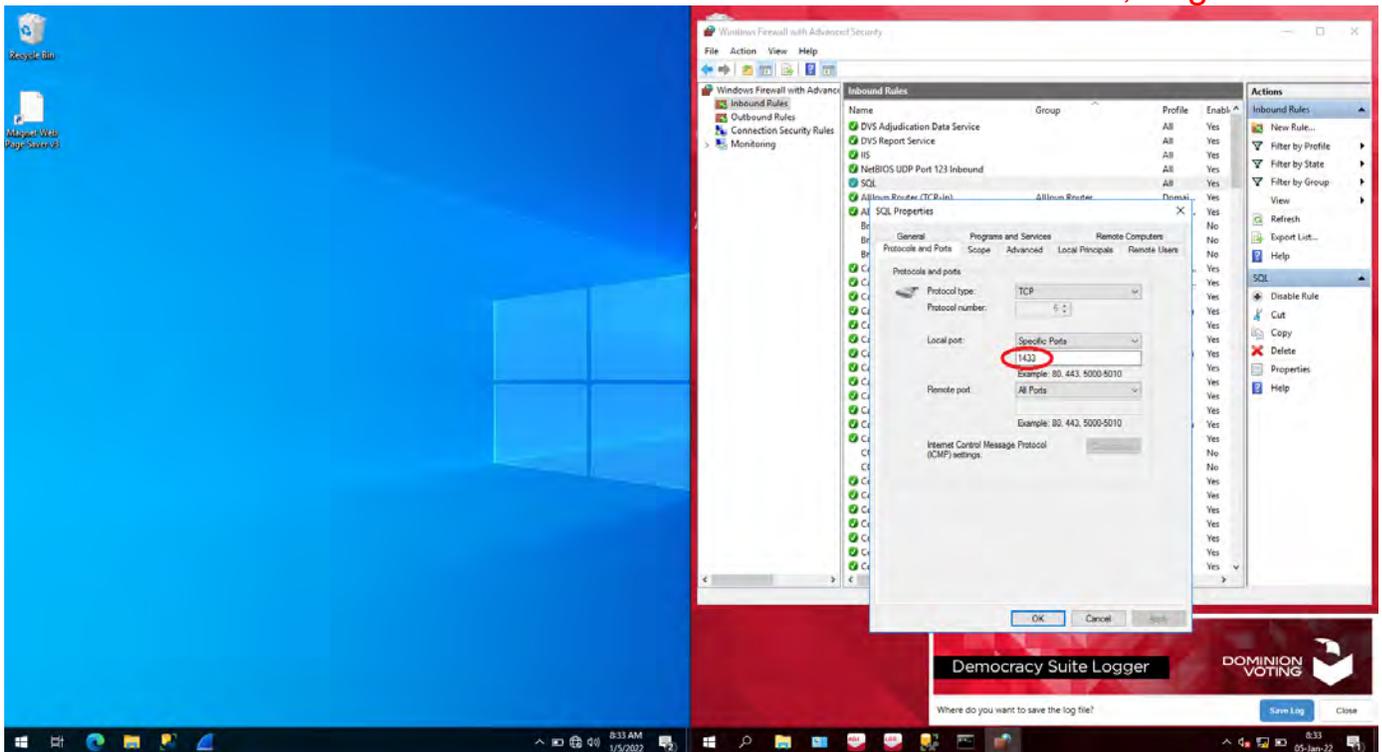

Figure 33 - SQL port 1433 is allowed.

The commonly-known default SQL Service, TCP port 1433 is specifically allowed by this firewall rule.

The port number selected for SQL database access could have been changed so that probing of the computer implicitly revealed less information. This is a recommended technique for high security networks where it is intended that the discovery of systems be disallowed; there are many other recommendations to be followed to truly harden the security of an operating system and its applications.
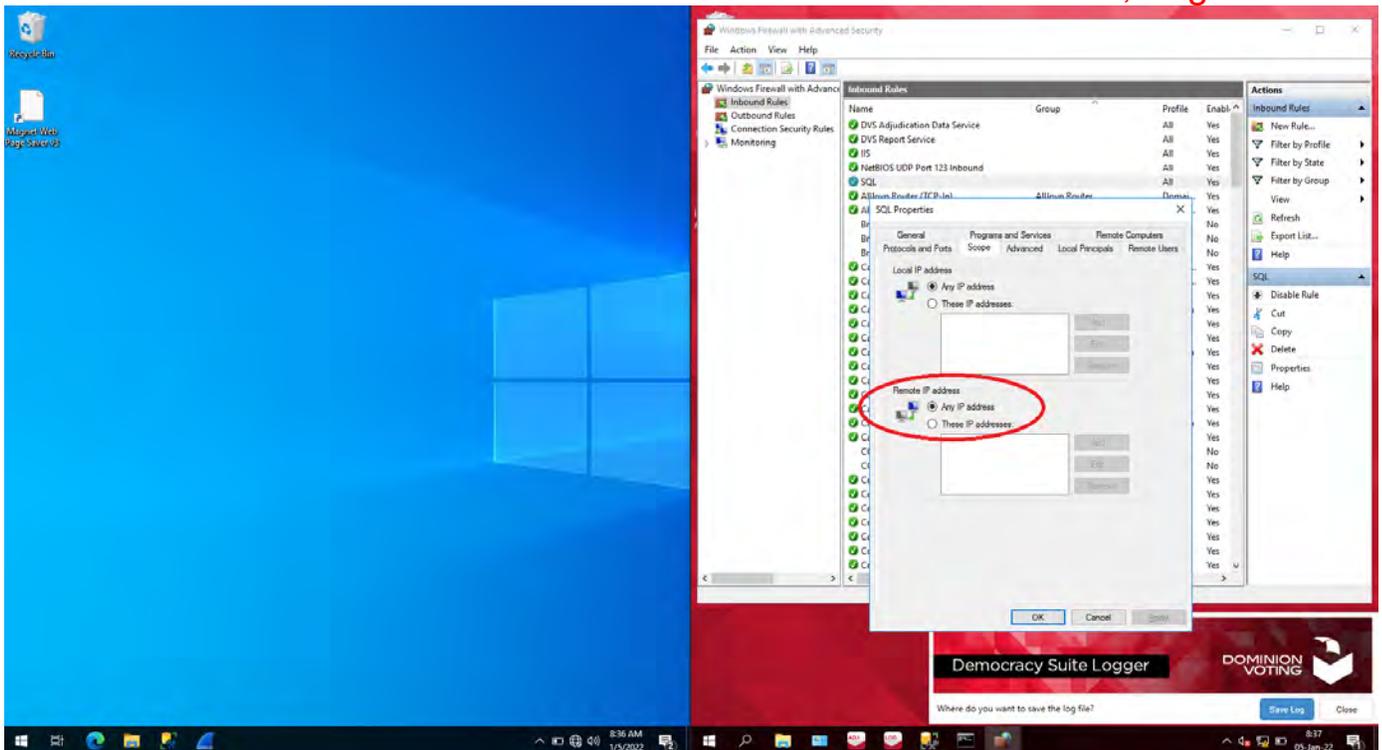

Figure 34 - Access to the SQL database standard port is allowed from ANY IP ADDRESS worldwide.

> **The IP address of the requesting computer is shown here as 'Remote IP address.' This rule is programmed to allow 'Any IP address' to connect to this port. Any IP address applies to any IP address anywhere in the world.**

The ability to make the server more secure has been included by Microsoft and made easy to implement in the graphical user interface (GUI), specifically by allowing for the specification of Remote IP addresses to be accepted (which would exclude all those not explicitly listed). Microsoft documentation states:

"**Any computer (including computers on the Internet)**: Not recommended. Any computer that can address your computer to connect to the specified program or port. This setting might be necessary to allow information to be presented to anonymous users on the internet, but increases your exposure to malicious users. Enabling this setting can allow Network Address Translation (NAT) traversal."

The option to specify a list of IP addresses is present in the GUI, "These IP addresses:" but is not selected.

Again, DVS had the option and opportunity to make the system configuration more secure, and neglected to or chose not to, and the individuals involved in the testing and certification either did not check or ignored the vulnerability.

Instead, they configured the option that Microsoft states is "Not recommended" and "increases your exposure to malicious users."
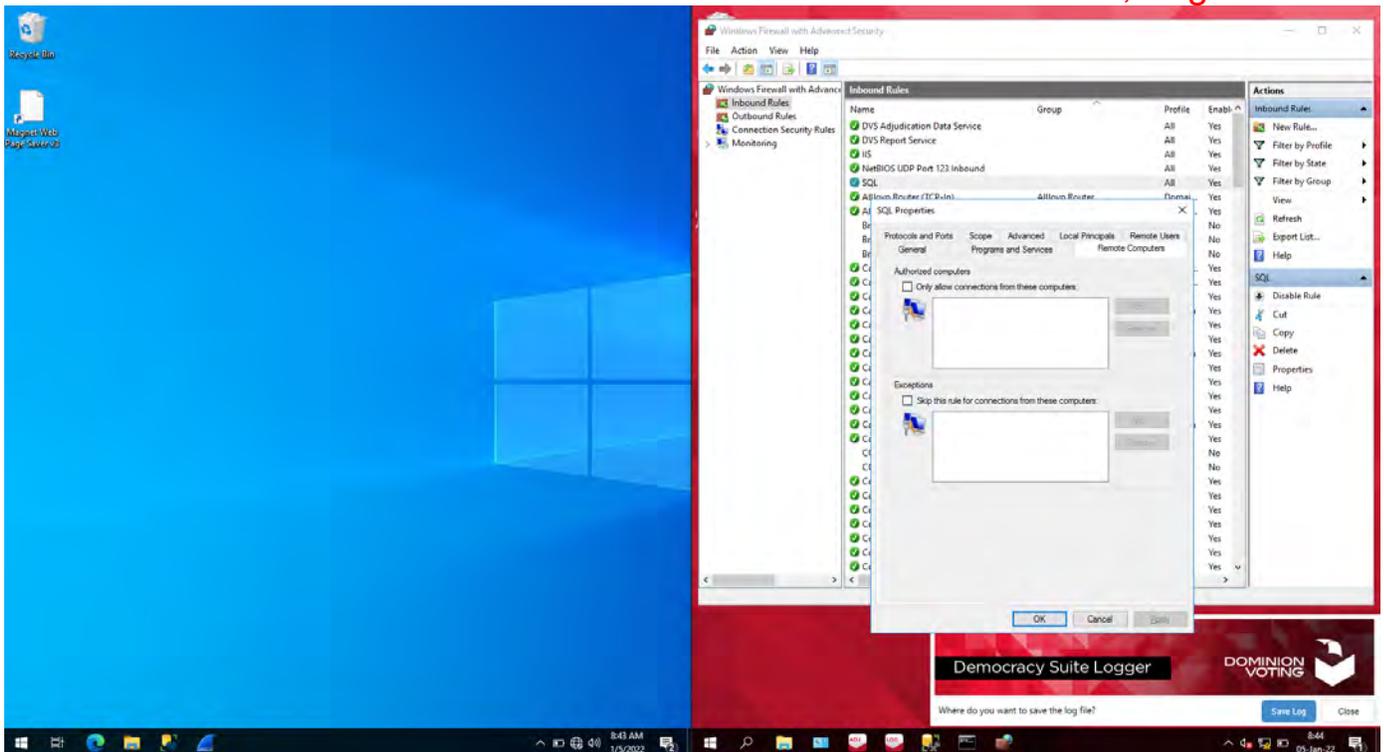

Figure 35 - No additional IP address restrictions or permissions

> No restrictions are in place on the firewall that require authentication or integrity-protected communication on the network. The vendor could have specified as "Authorized computers" only those computers and devices deployed within the DVS D-Suite 5.11-CO voting system configuration in Mesa County, and excluded any and all other computers and devices in the world. But the vendor does not restrict that communication and, again, neither the voting system testing lab nor the Secretary of State staff took note or action regarding that neglect of a required security setting. For such a 'secure' critical system ("critical infrastructure," according to the U.S. Government), there is no excuse for this lack of security to help guarantee integrity of each citizen's vote.

It is possible to restrict access to a designated set of computers and even ensure that the connections are authenticated and integrity-protected. The functionality for this is built-in to the operating system, had the voting system vendor chosen to configure it. This safeguard of network traffic authentication and integrity-protection is available, but unused by DVS in this image of the Mesa County EMS server configuration.
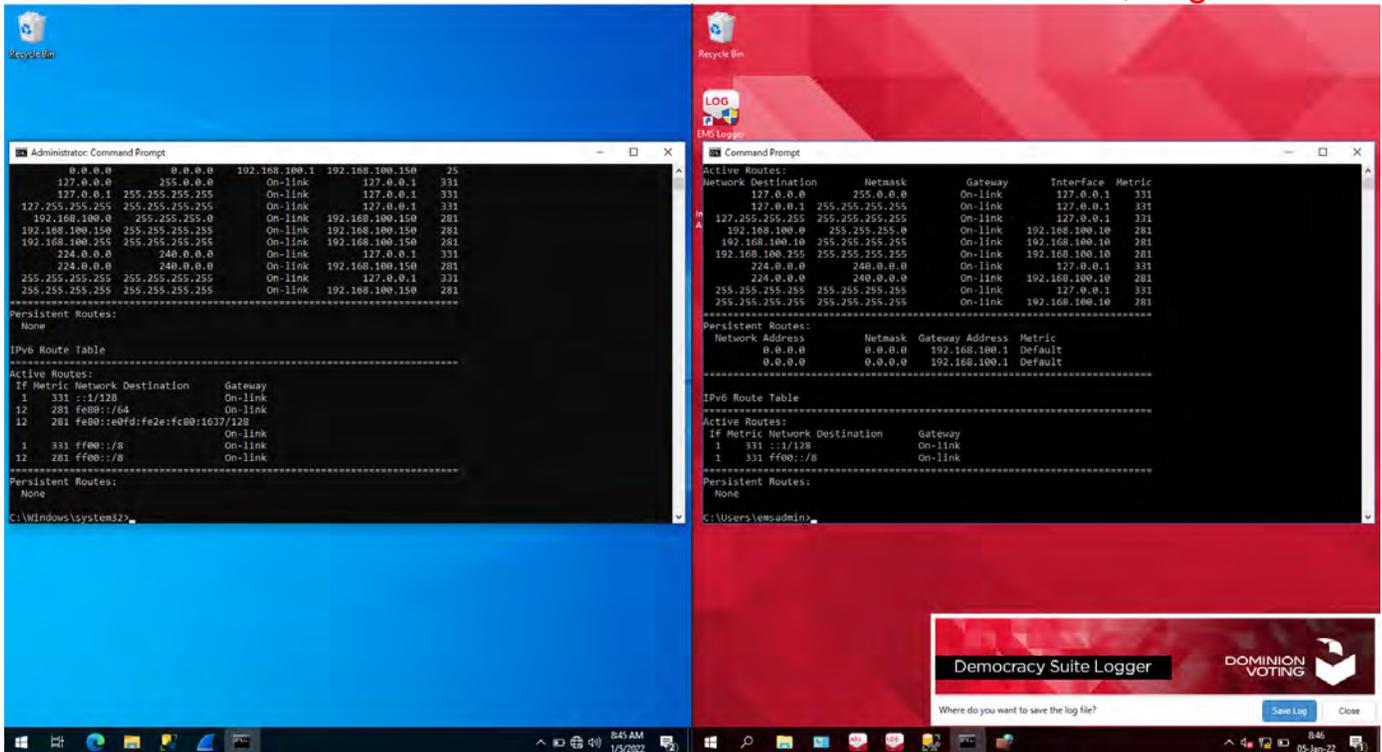

Figure 36 - Test Workstation, 192.168.100.150, and EMS, 192.168.100.10, are on the same subnet

> **This is demonstrating that the IP address for the Test Workstation on the left is on the same subnet as the IP address for the EMS Server on the right.**

This address configuration shows that the test workstation and the EMS server are configured on the same subnetwork, i.e., "subnet," e.g., they should be able to connect to each other if there is not something restricting them from doing so. If they were not on the same subnetwork, a router would be required but is unnecessary in this examination for the finding demonstrated here.

Testing the connection from an external Test Workstation tests the totality of the EMS server configuration and assures that claims of being able to connect from a separate computer not part of the DVS system are valid. Specifically, this test assures that no additional countermeasures or configuration of the EMS server are overlooked in arriving at this conclusion.
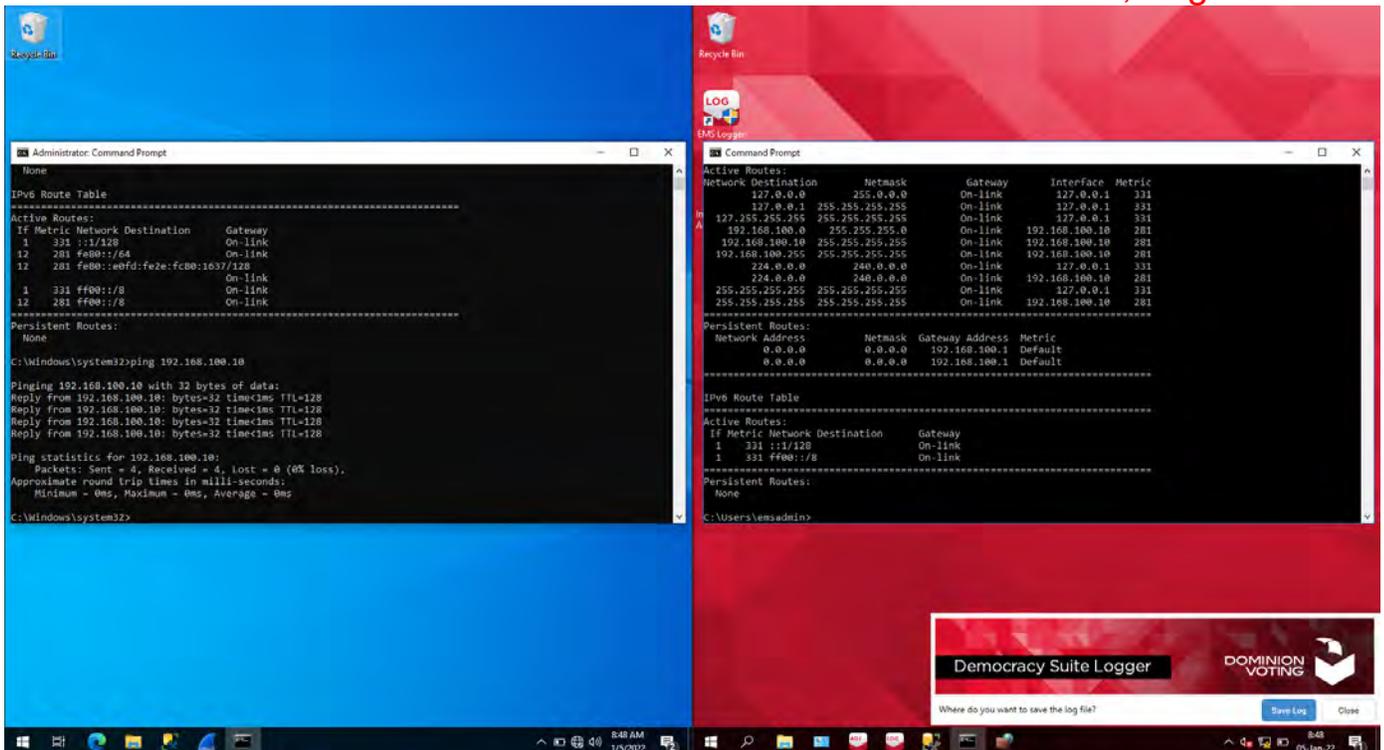

Figure 37 - Mesa EMS server is responding to network ping test.

'Ping' is another common diagnostic utility being used to determine if the EMS server on the right responds to the request from the Test Workstation on the left. All 4 responses were received by the Test Workstation from the EMS server, in response to the 4 requests sent by the Test Workstation.

In a properly highly secured network, one would expect the Internet Control Message Protocol (ICMP) request to be disallowed on the EMS server, in order to help prevent the unauthorized or malicious discovery of the DVS D-Suite network structure of devices and addresses.

This test demonstrates the lack of such restriction: the EMS server responded to the request.

The ping test uses Internet Control Message Protocol (ICMP) and transmits an "echo request" to the echo service on a remote computer. The remote computer responds and the original computer records the time it took to return the request. This is commonly used to determine if a device with a particular IP address is present on a network. This test demonstrates that the Test Workstation is connected to the EMS server across the network.
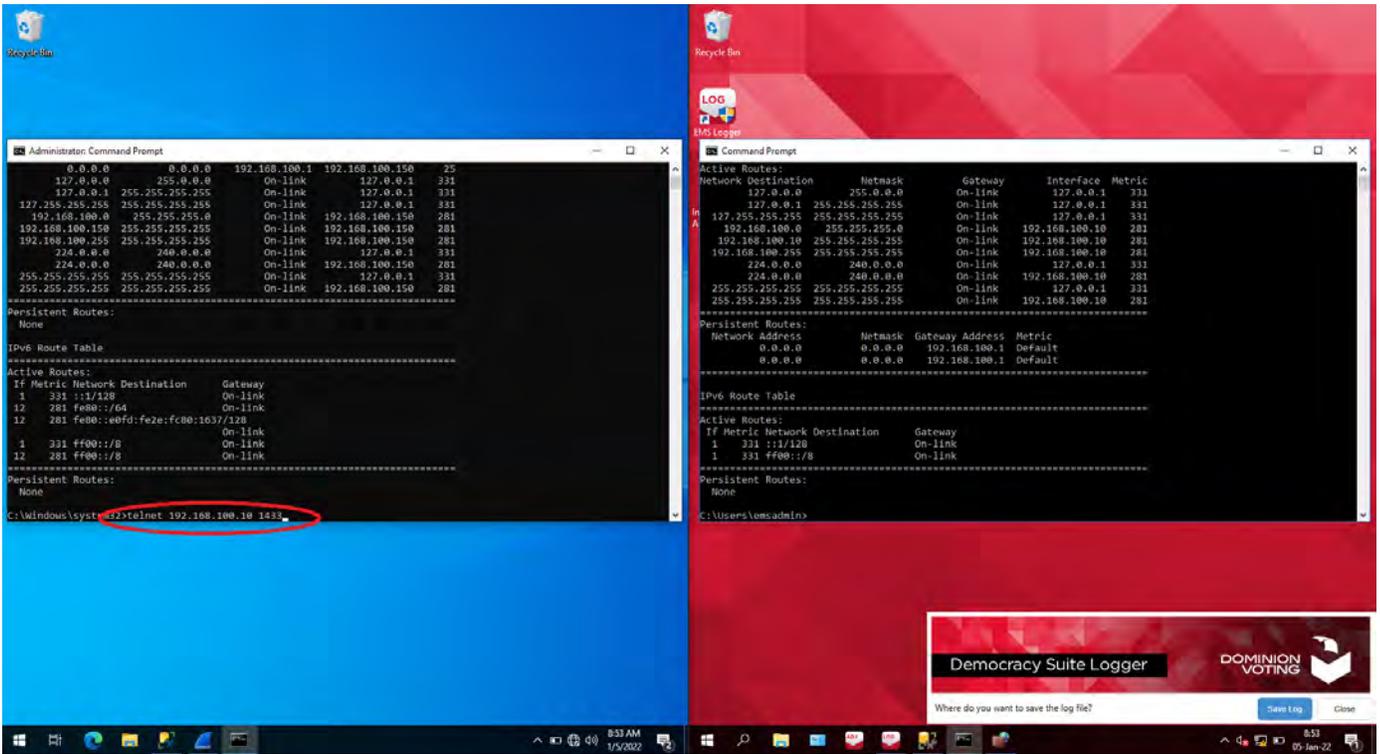

Figure 38 - Telnet connectivity test from separate computer not part of the Dominion system

The same 'Telnet' command (as in Figure 28) is used to see if the commonly-known default configured SQL Server port of 1433 on the EMS server at 192.168.100.10 can be connected to this alternate non-DVS D-Suite system.

Having established that the test workstation can connect to the server IP address, the Telnet command is used to test the connection to the EMS server's SQL service. Previously this connection was attempted from the EMS server to itself. The connection from the Test Workstation, a separate computer not part of the DVS D-Suite system, is attempted here.
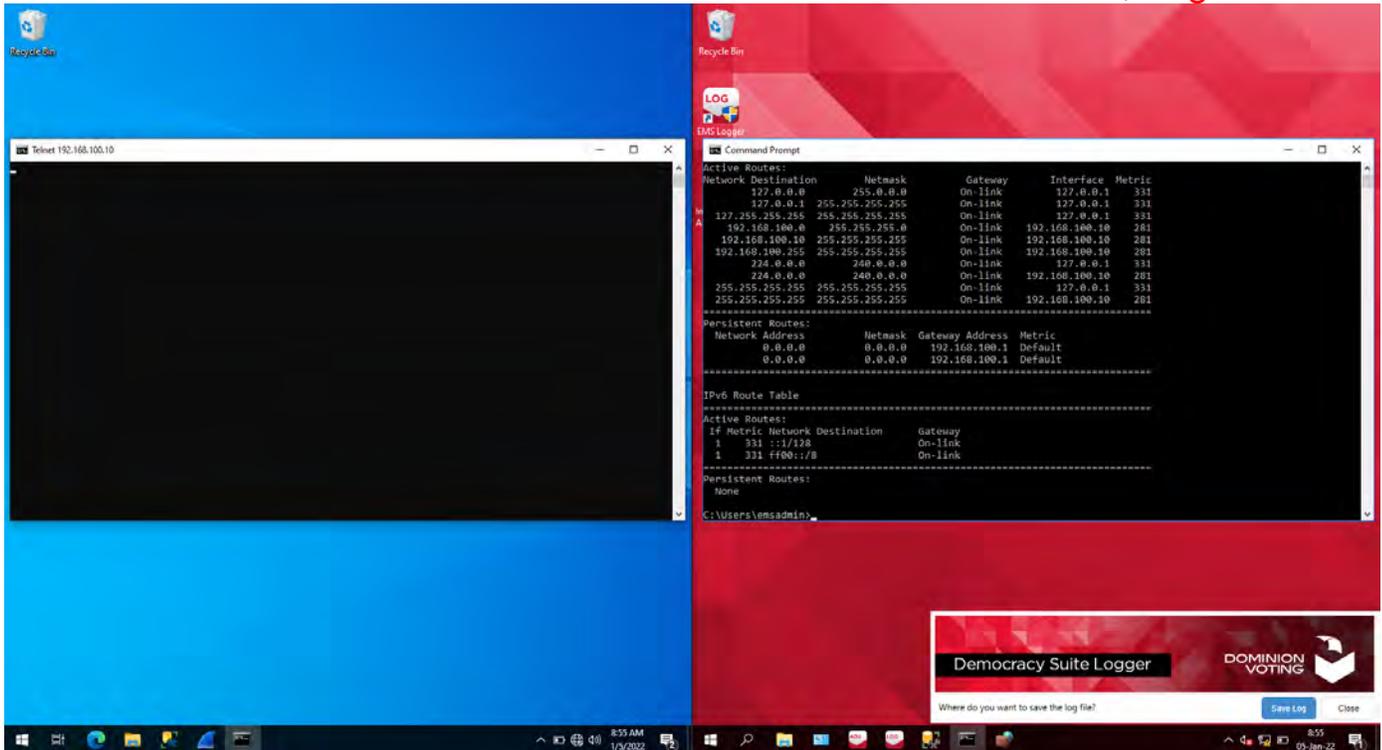

Figure 39 - Telnet to EMS server port 1433 (SQL) succeeds

> **Just as when this same test was run on the EMS server itself, the connection to the SQL Server port 1433 on the EMS server is successful from the Test Workstation.**

The Telnet utility from the Test Workstation is able to connect to the EMS server showing, as in the Telnet test from the server to itself, that the SQL database service port is operating and listening for connections, and accessible from a non-DVS D-Suite computer.
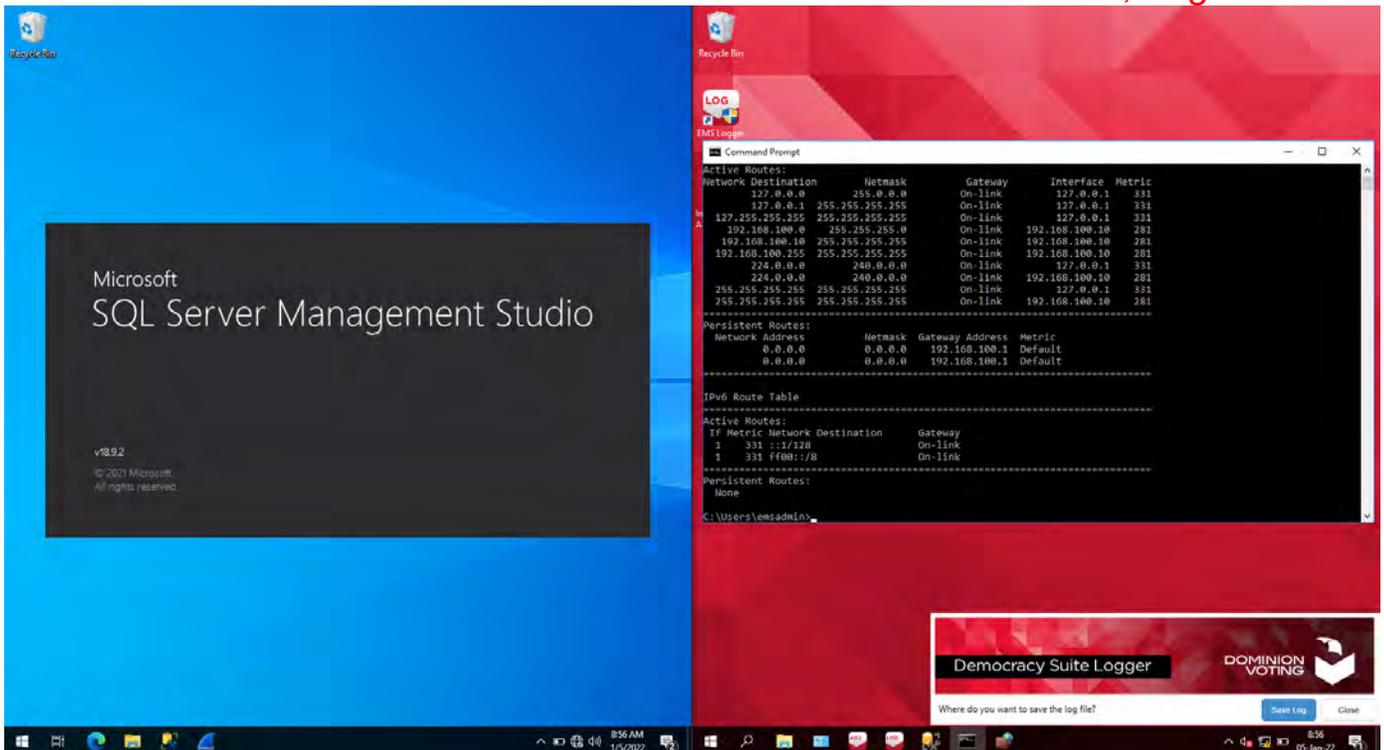

Figure 40 - SSMS access test from separate computer not part of the DVS D-Suite system

> **SSMS is downloaded from Microsoft and installed on the Test Workstation. Here, it is started, just as it was on the EMS server previously.**

Anyone could do this by following the simple directions found with an Internet search for 'how to download SQL server management studio.' There are also many videos on the internet that walk even a novice through doing so.
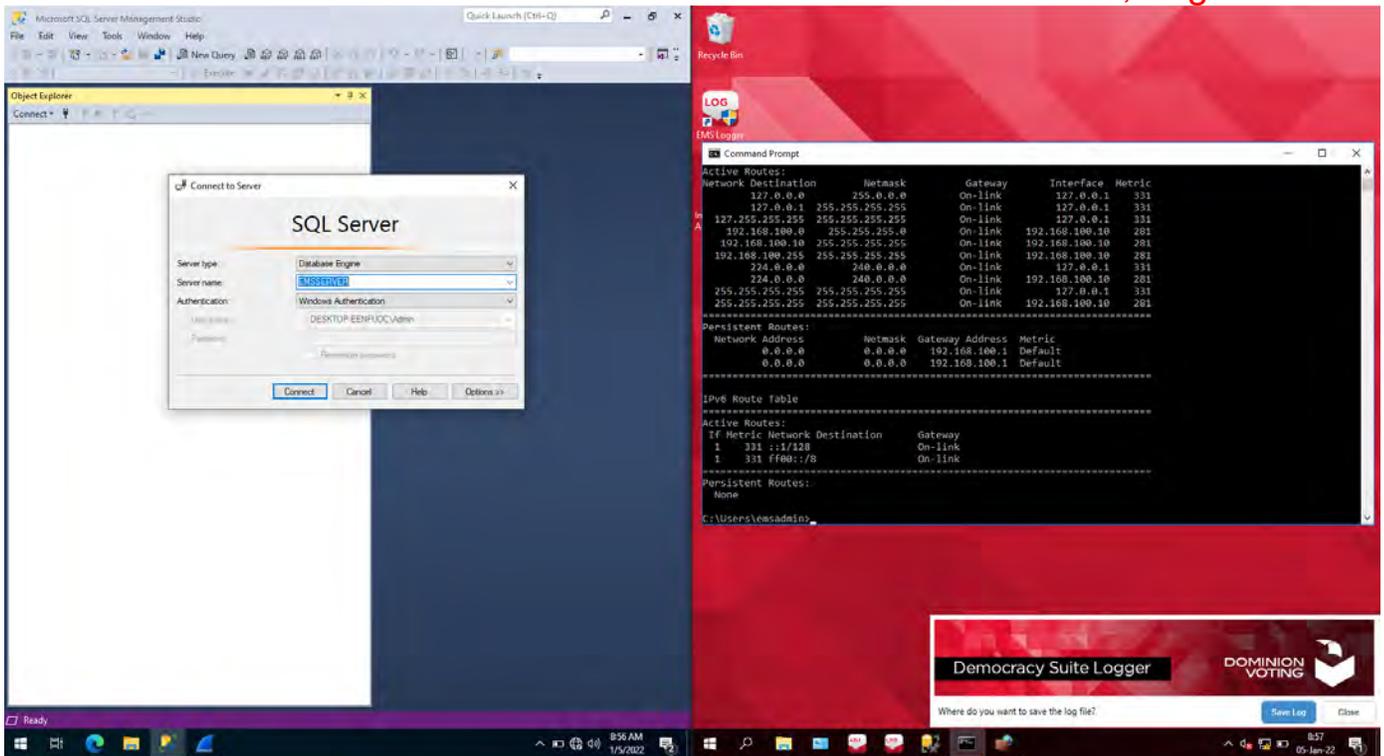

Figure 41 - Log In to the server

A user account was created on the Test Workstation using the same username and password that was used to log in to the EMS server on the right. SQL Server Management Studio was started and the same computer name 'EMSSERVER' was typed into the 'Server name' field on the Test Workstation.
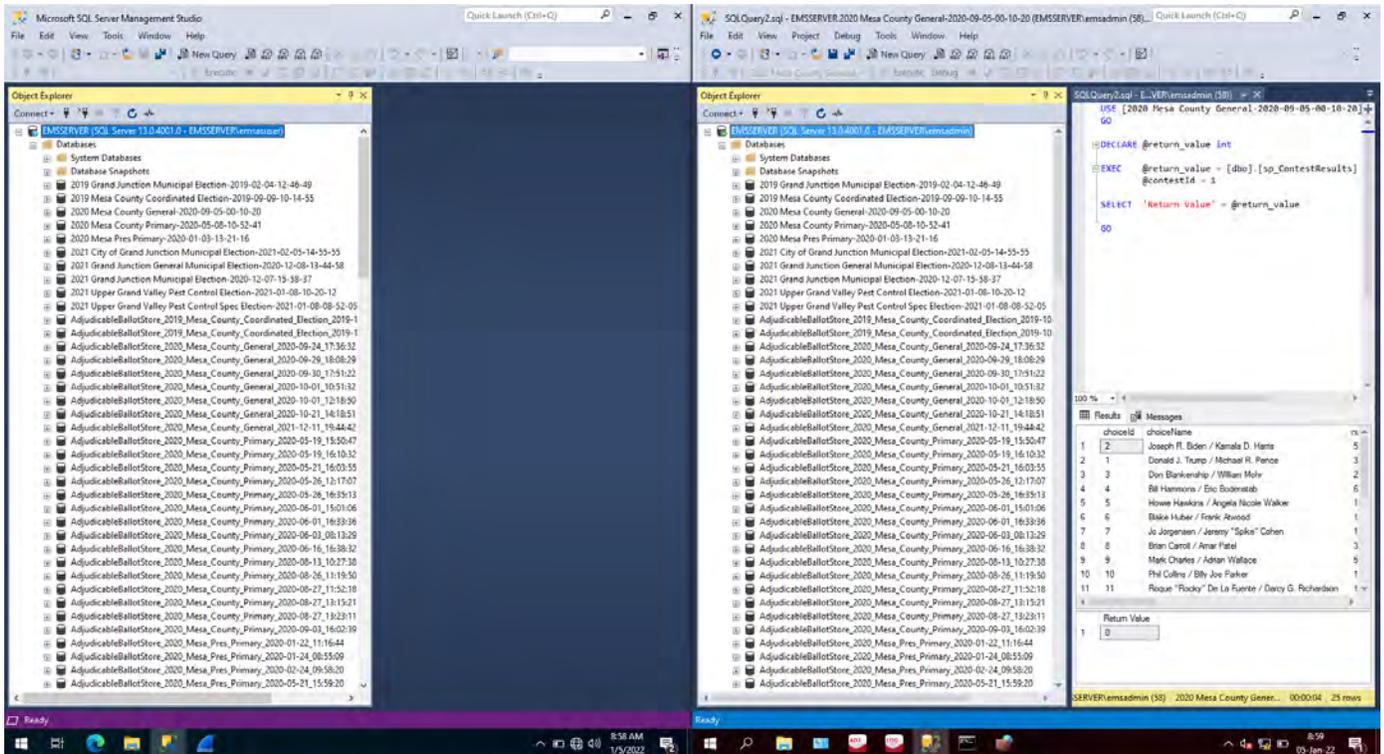

Figure 42 - From a separate Windows 10 computer EMS server database access has been obtained.

> **After clicking 'Connect,' SQL Server Management Studio connected successfully without so much as a warning. Clicking on the '+' next to Databases reveals the same list of databases available on the EMS server itself, accessible from the Test Workstation.**

In Figure 42 I have obtained access to the EMS server from a separate computer not part of the Dominion system and can see election databases. On the left side of the screenshot, the display from the test workstation is shown and on the right side of the screenshot the display from the EMS server is shown. Both systems show the same databases listed. Remote access (i.e., from a separate computer not part of the Dominion system) to the database has been obtained by the Test Workstation.
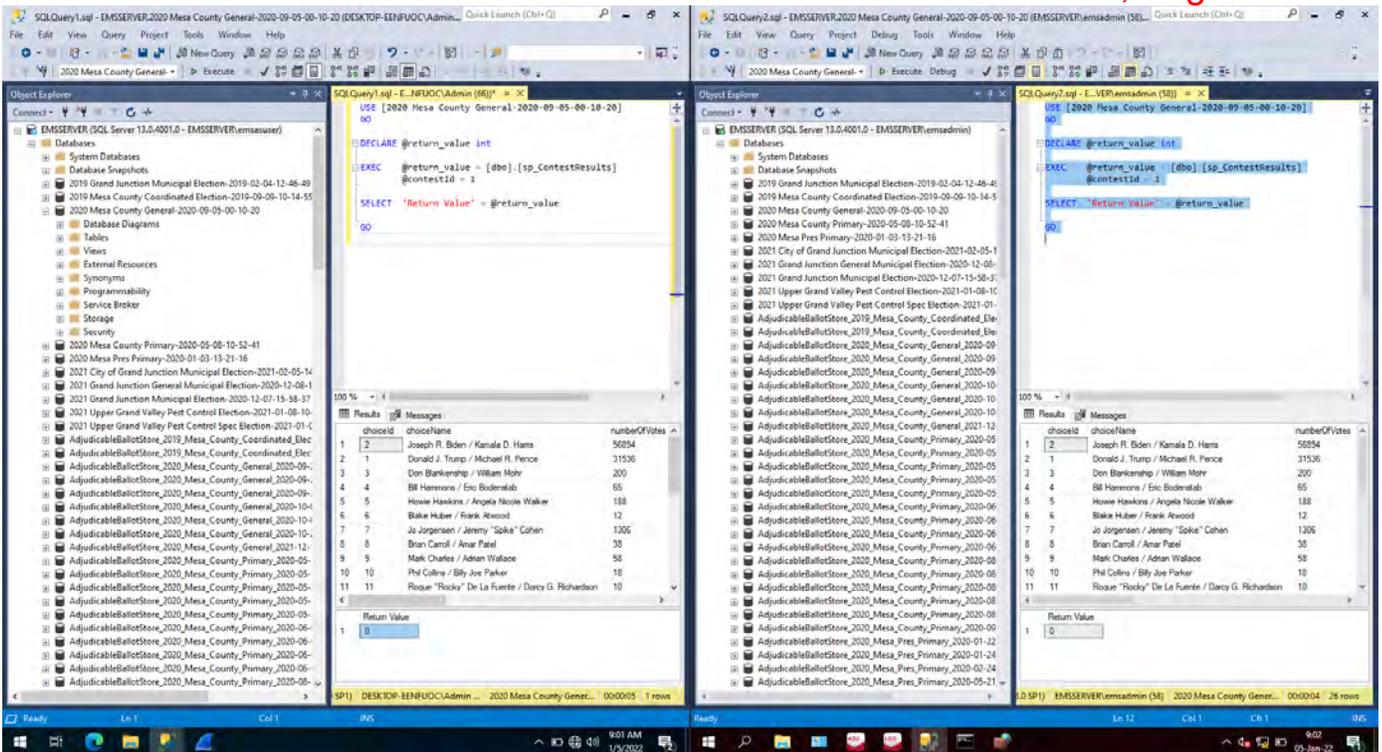

Figure 43 - From a separate Windows computer, the databases can be accessed and reports run.

> To confirm this is the data directly from the EMS server, the same report is run on both systems. They both report identical information from the database.

The results display the database in the altered state in which it was left, showing the flipped 56,894 votes for Biden and 31,536 for Trump from the test illustrated in Figure 28.

Finding 5: The security configuration of the Mesa County EMS server permitted access to election data and records from a separate computer not part of the DVS D-Suite system.
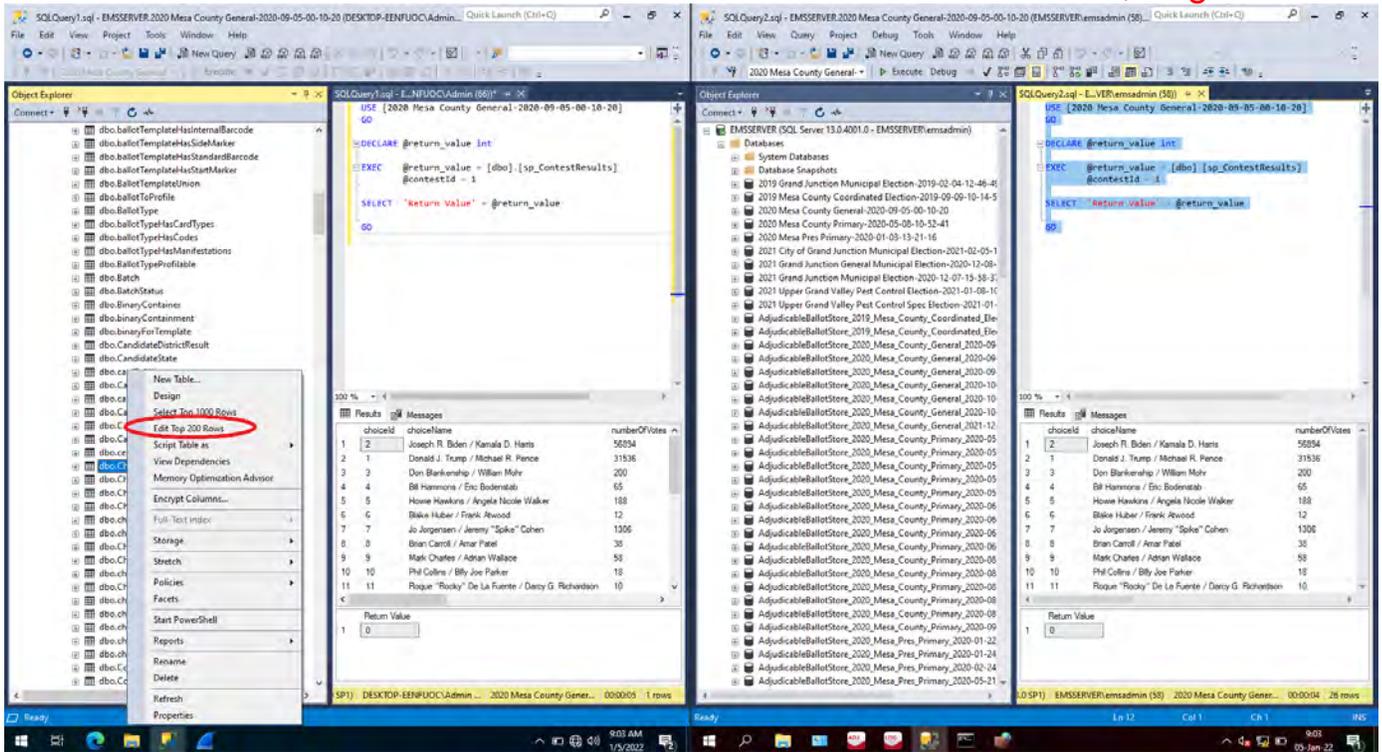

Figure 44 - SSMS permits database Edit

I again right-click on the 'dbo.Choice' table and then select 'Edit Top 200 Rows'.

As previously shown via the EMS server itself, using Microsoft SSMS on a separate computer, not part of the DVS system, access was gained to the same data and the same operations performed as if it was done on the EMS server itself.
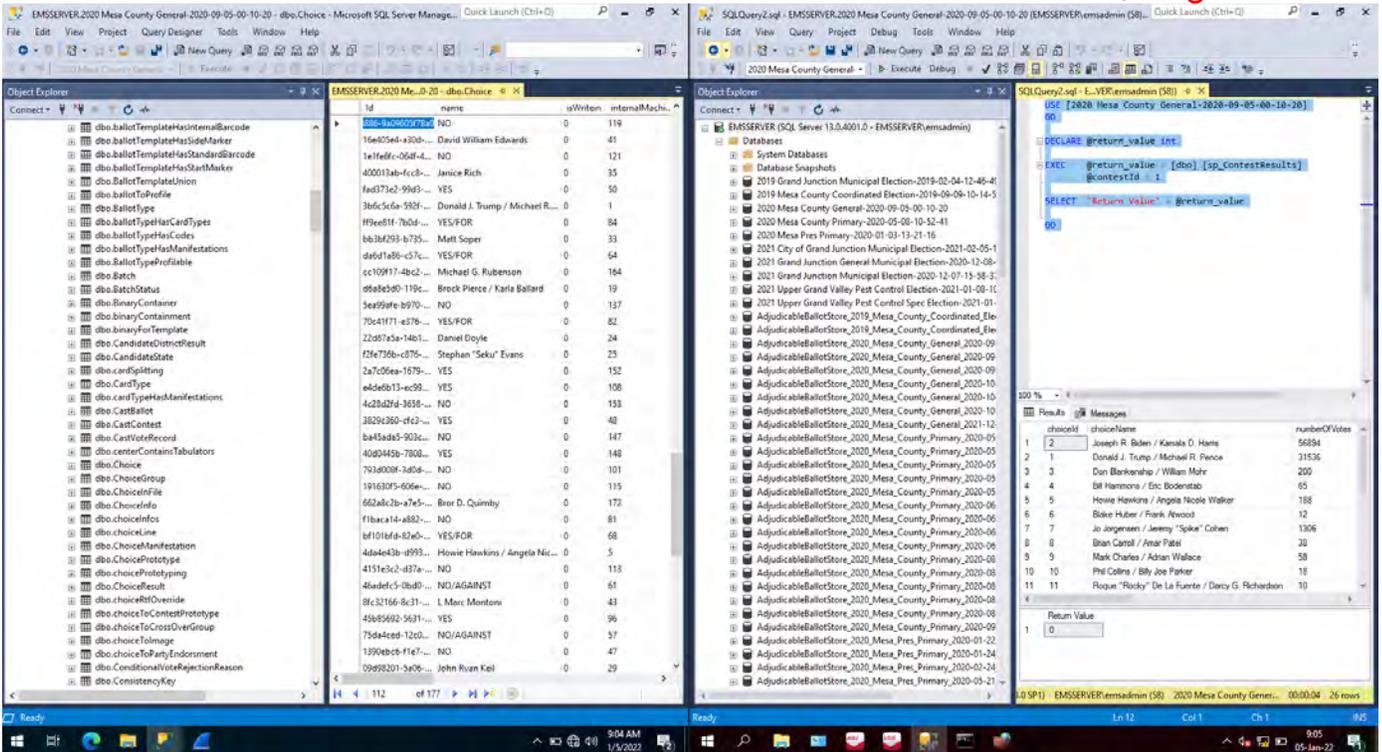

Figure 45 - EMS server Database view from a separate computer not part of the DVS D-Suite system

---

SSMS shows the same table in the same format as it did on the EMS server.

In Figure 45 the top 200 rows of the election database are available for editing using SSMS running on the Test Workstation to access the Mesa County EMS server across the network. The internalMachineId for Biden is still '2' and for Trump it is still '1' from the previous alteration in Examination Objective 1 (Figure 26).
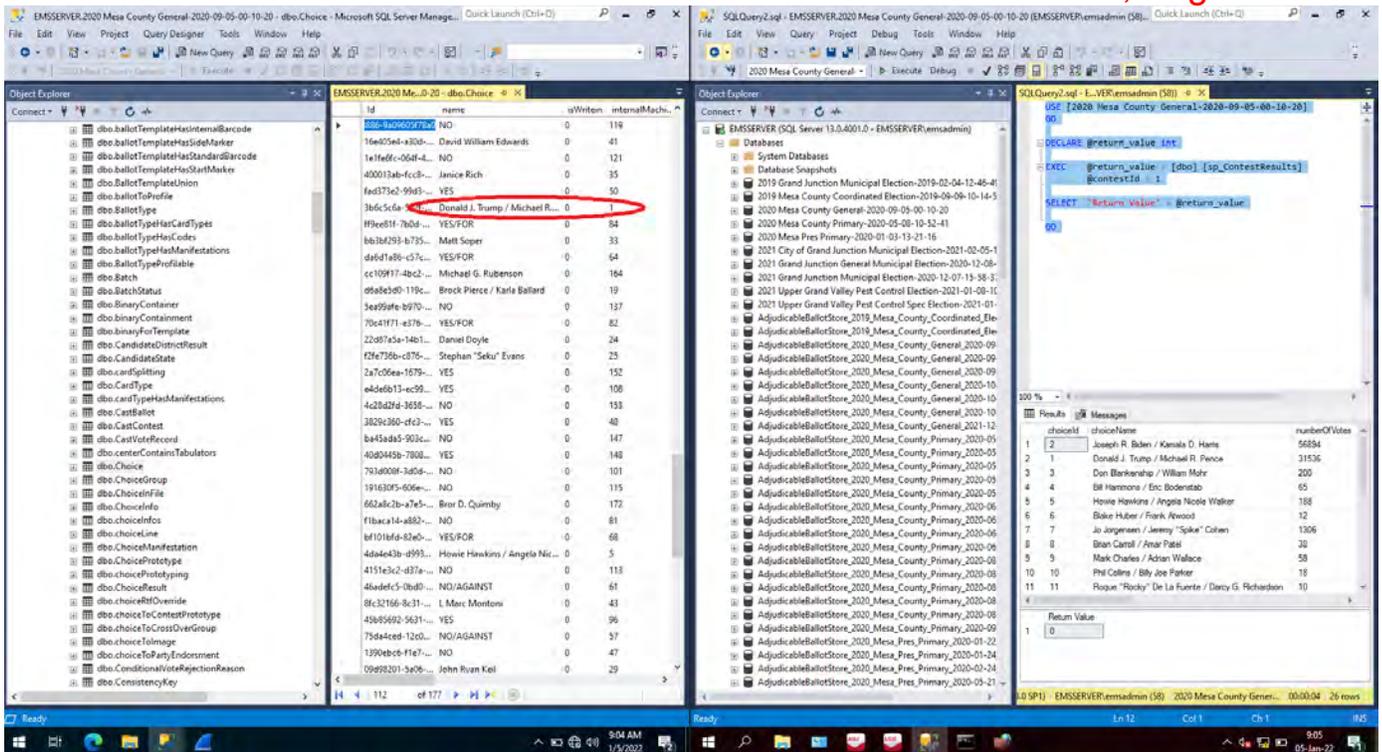

Figure 46 - SSMS permits us to edit the databases

A successful attempt to edit the election database on the EMS server, from the Test Workstation, is made to reverse the changes made earlier, thereby altering them back to the original results. Note the current setting of internalMachineId for Trump is '1.'
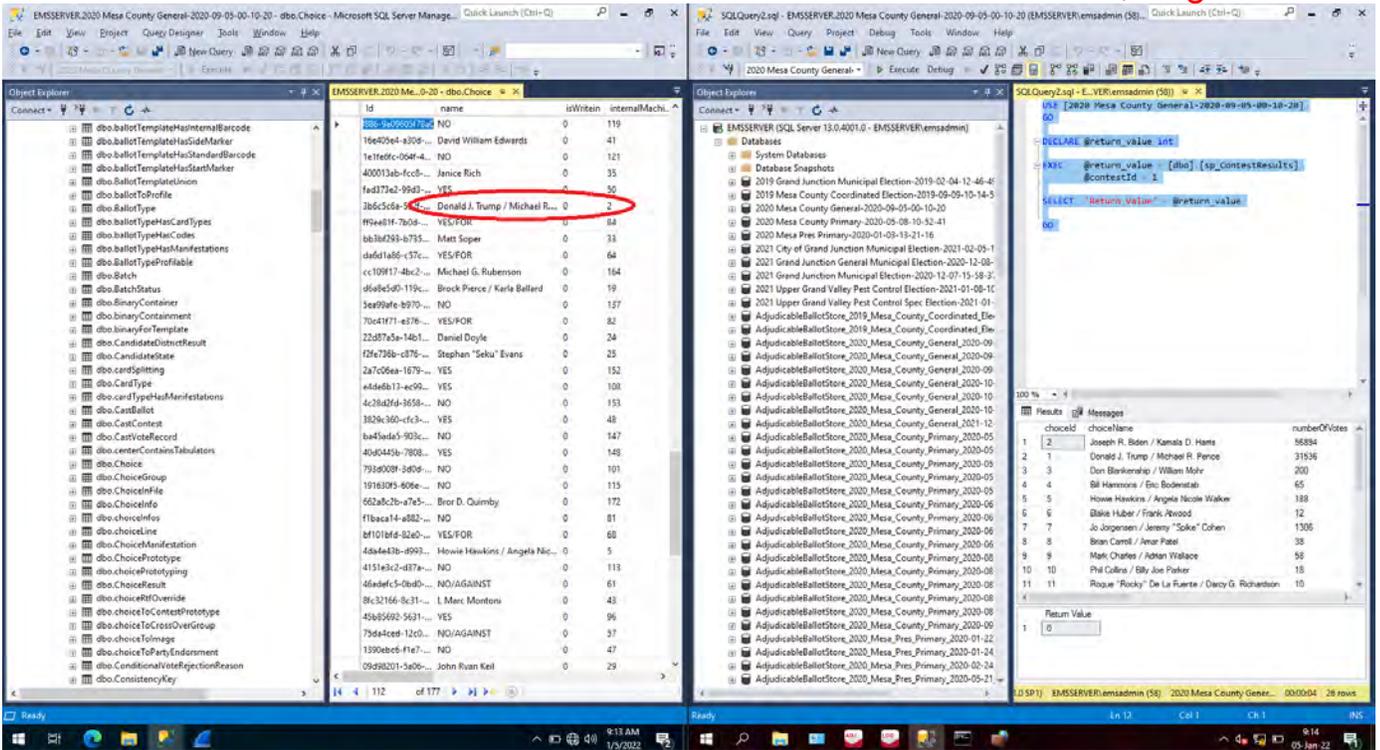

Figure 47 - "internalMachineId" for Trump is now changed back to a 2.

The "internalMachineId" for Trump is changed back to "2." The database server allows this alteration from the Test Workstation without any error or warning.
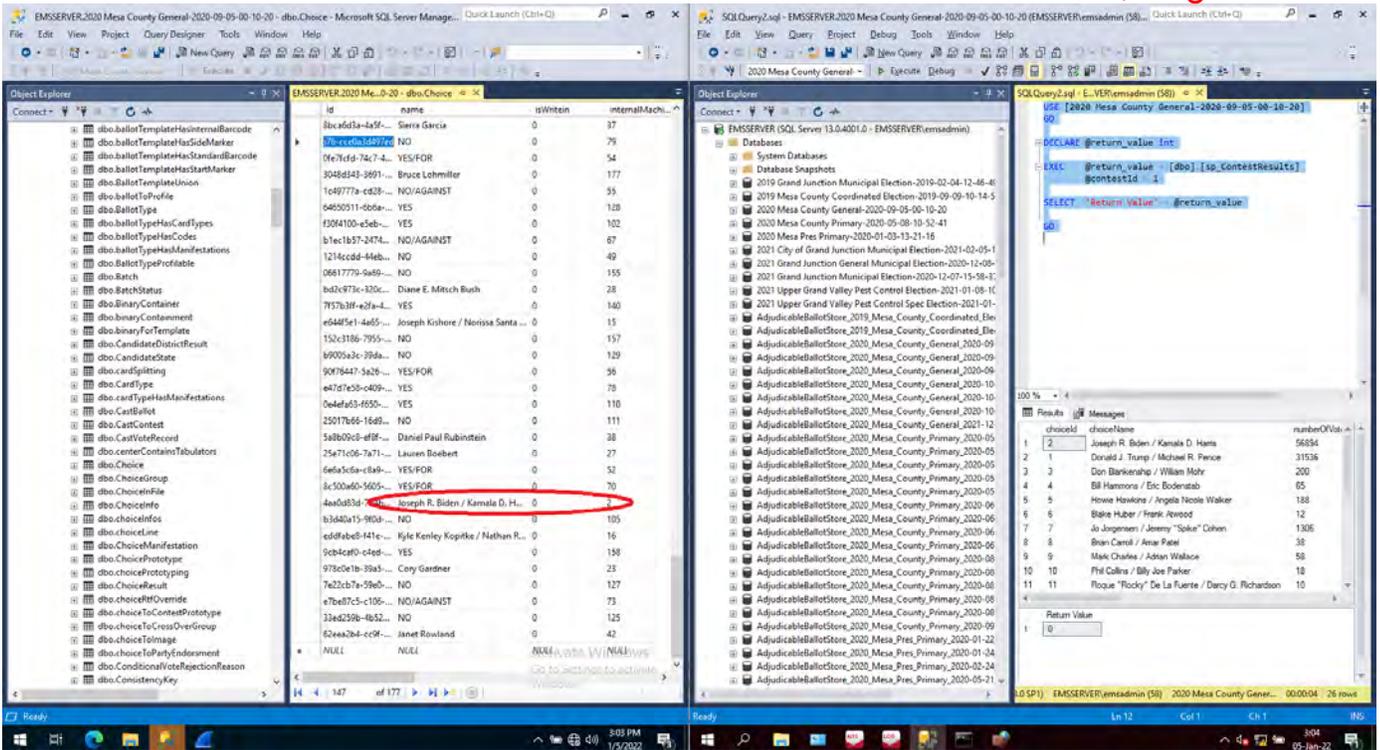

Figure 48 - Candidate data for Biden from previous change

The current "internalMachineId" for Biden is still "2", in the election database on the EMS server, as changed earlier from the EMS server.
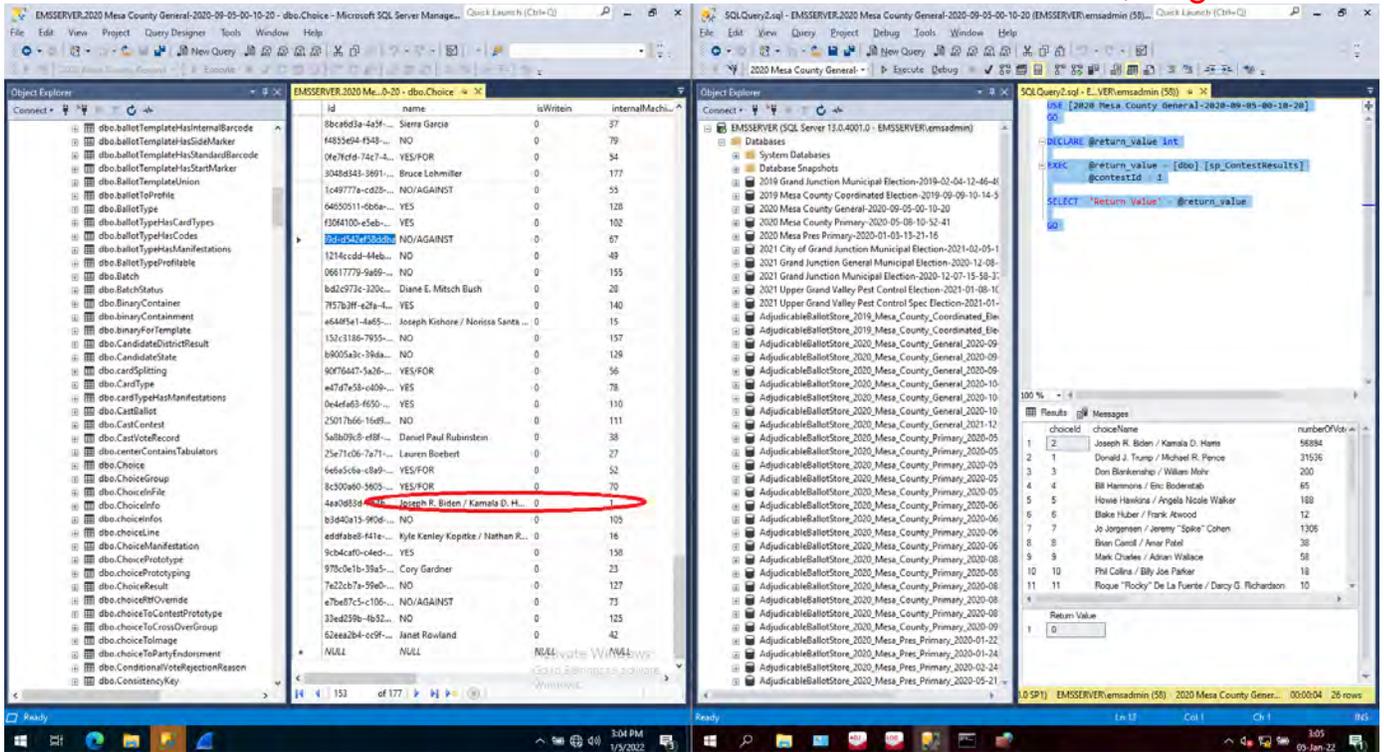

Figure 49 - Candidate data for Biden changed back to original

> I next change, from the Test Workstation, the "internalMachineId" for Biden in the election database on the EMS server back to "1", its original value. There is again no error or warning given.

As one can see, this alteration of the voting database was also successful. The system has been restored to the state in which it was found prior to making the first alteration of the voting system database.
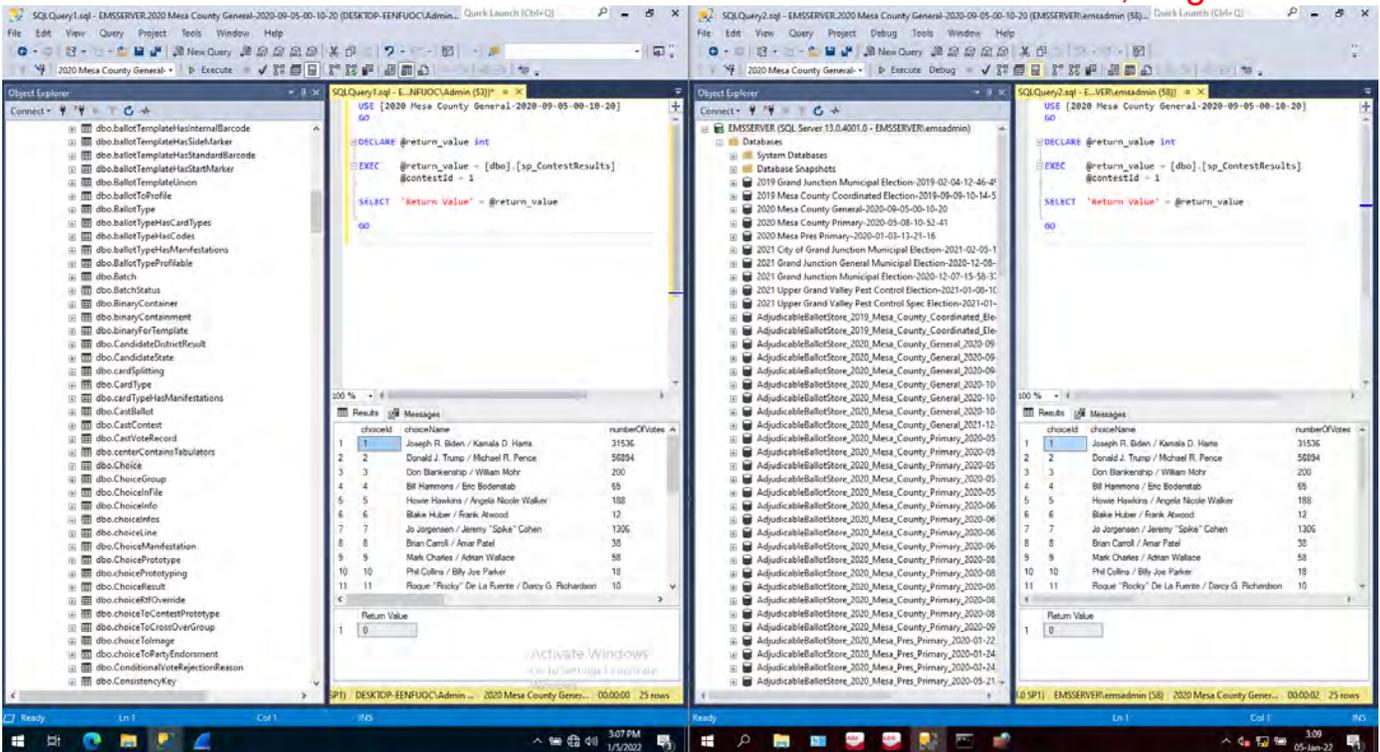

Figure 50 - The vote choice was remotely changed back to its original state

> The alterations of the vote totals in the election database on the EMS server also succeeded from a separate computer not part of the DVS D-Suite system. Queries were executed both from the Test Workstation and on the EMS server, and both results again show that it is possible by anyone with physical access to a Dominion Computer or any part of the voting system network to alter the entire election result on the EMS server by changing only two values, with knowledge nearly anyone could attain by using Google and watching one or more YouTube videos.

The query is run on both systems to show that the database results have changed back.

> **Finding 6: The Mesa County EMS server containing the 2020 General Election vote results has been shown to be insecure and grossly misconfigured such that it allows unrestricted access to the election database and enables changing calculated vote totals from a separate computer not part of the DVS D-Suite system with nothing more than the knowledge of a password. It was possible to access the EMS server and, by changing only 2 numbers in the database, completely alter the election results in Mesa County for the 2020 Presidential election.**

> EXAMINATION RESULT 2:
>
> The election results database CAN be altered by any person using a non-DVS D-Suite computer directly or indirectly connected to the EMS server network.

EXAMINATION OBJECTIVE 3:

Determine whether the calculated vote totals of an election can be altered by any person using a cell phone or mobile device wirelessly connected to the EMS server network.
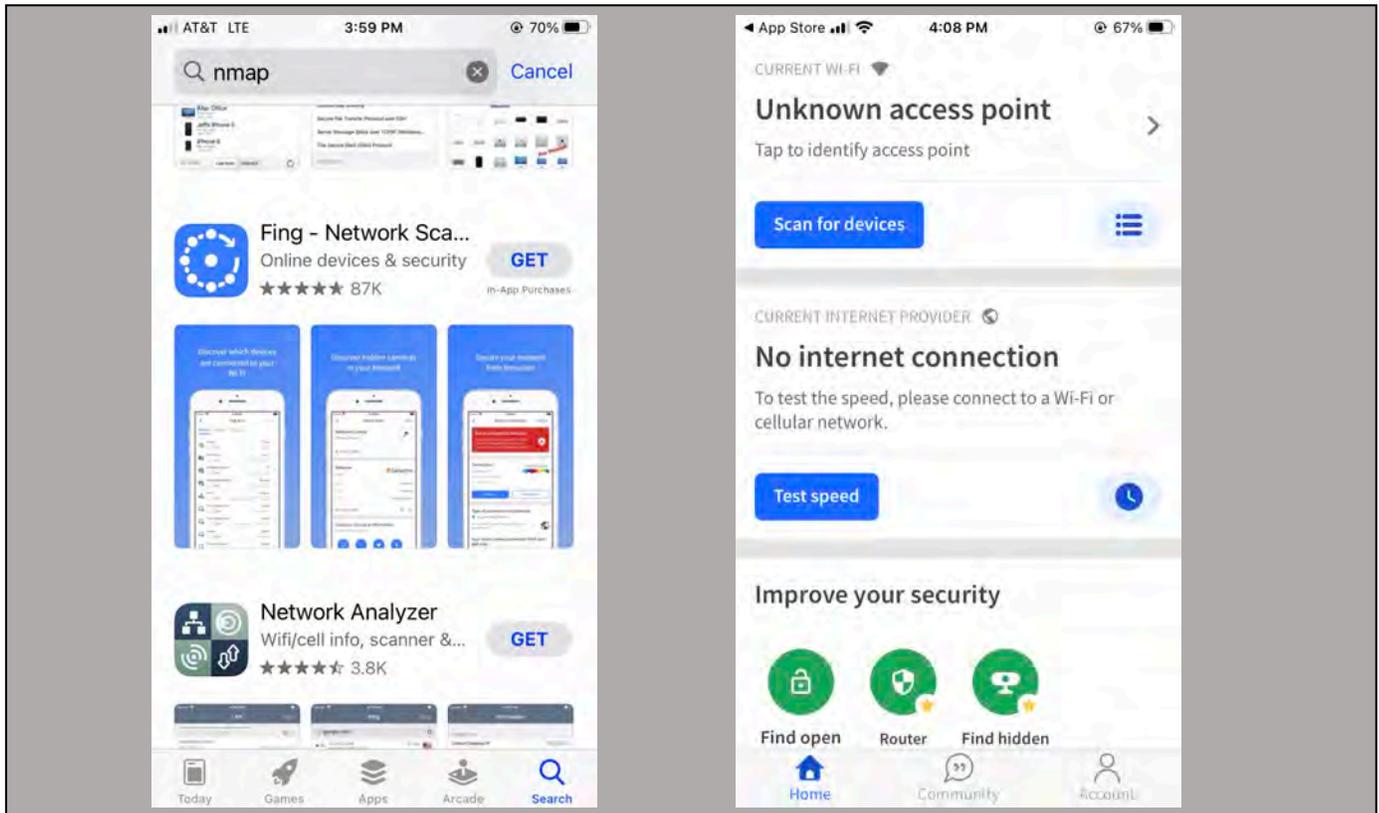

Figure 51 - Network scanner installed on cellphone

> **An iPhone was connected to the same network, wirelessly, using a common wireless router purchased at a retail store. A router such as this could be plugged in and hidden anywhere on the DVS D-Suite network, or the same functionality could be inserted electronically via common hacking into any device on the network with a wireless card, including network printers and network scanners. As discussed earlier, thirty-five (35) devices of the existing DVS-supplied equipment already had a built-in wireless card or device installed, as well as a wireless-capable printer, so this could have easily been done without attaching any devices outside the system components. The Apple App Store was searched and a common network scanner 'Fing' was easily found. As one can see, 'Fing' has already been downloaded over 87,000 times. In the image on the right, 'Fing' was run and the option 'Scan for Devices' was selected.**

Previously an Island-Hopping attack was described. For such an attack to occur, a connection to a different network is used.

This part of the examination was carried out to determine whether the system could have been accessed wirelessly using the more limited capabilities of a mobile device (a cell phone in this test). Thirty-five (35) wireless devices were identified within the Mesa County DVS D-Suite system. In order to perform this part

of the examination it was necessary to mimic the actual MESA hardware, so a wireless access point was connected to the VirtualBox test system that was running the actual software of the Mesa County EMS server via a host-based network interface card.

If any wireless device gains access to any device connected to the EMS infrastructure (as was demonstrated here), including the inadvertent enabling of even a laptop wireless interface (typically performed by a single button press on the keyboard of a laptop, or by preprogrammed, triggered activation of internal code on the device, or by remote command from an actor with access to the device), such an attack could easily occur.
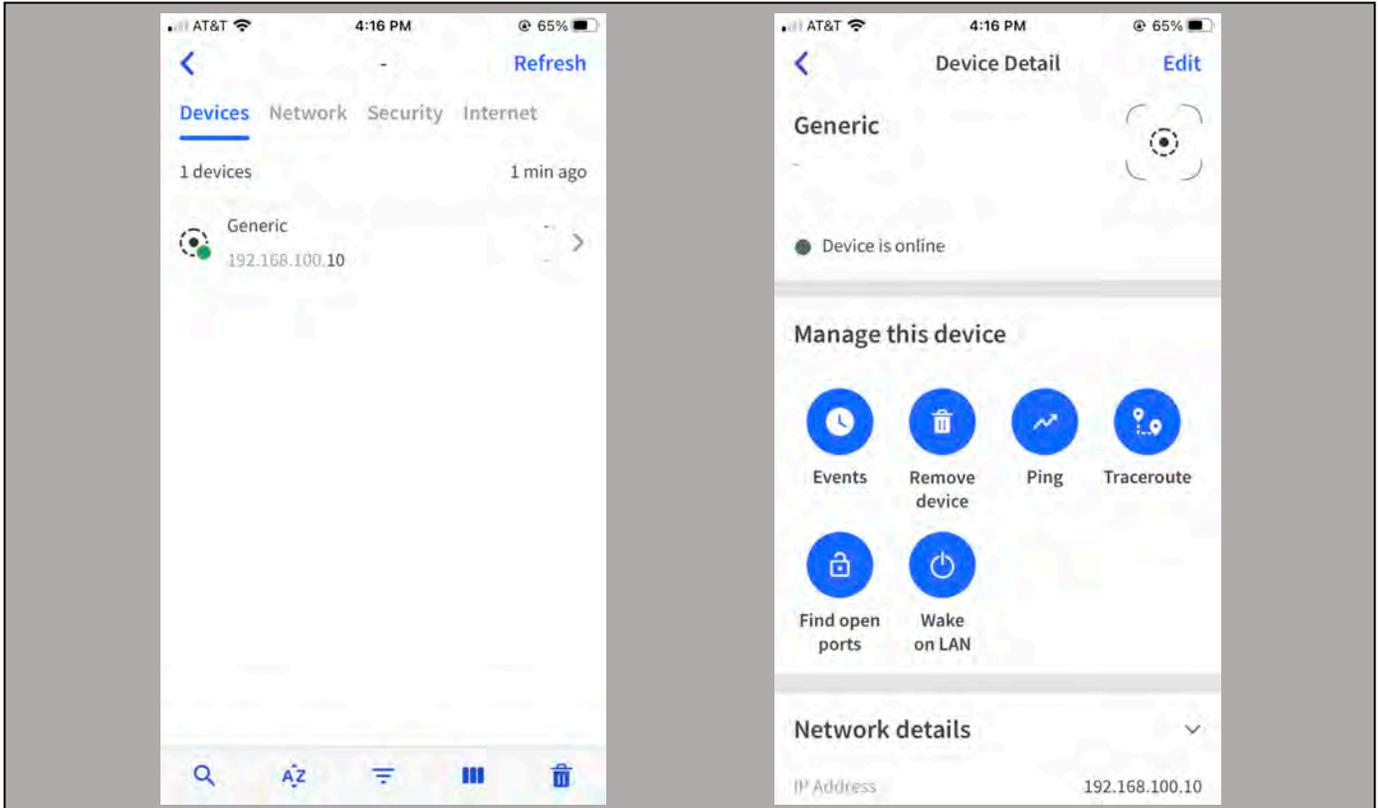

Figure 52 - IP address for the EMS server found via wireless connection and iPhone app

On the left, the network scanner immediately finds the IP address for the EMS Server and displays the IP address (192.168.100.10). The device is selected, and on the right, the phone app presents more options. I then selected "Find open ports."
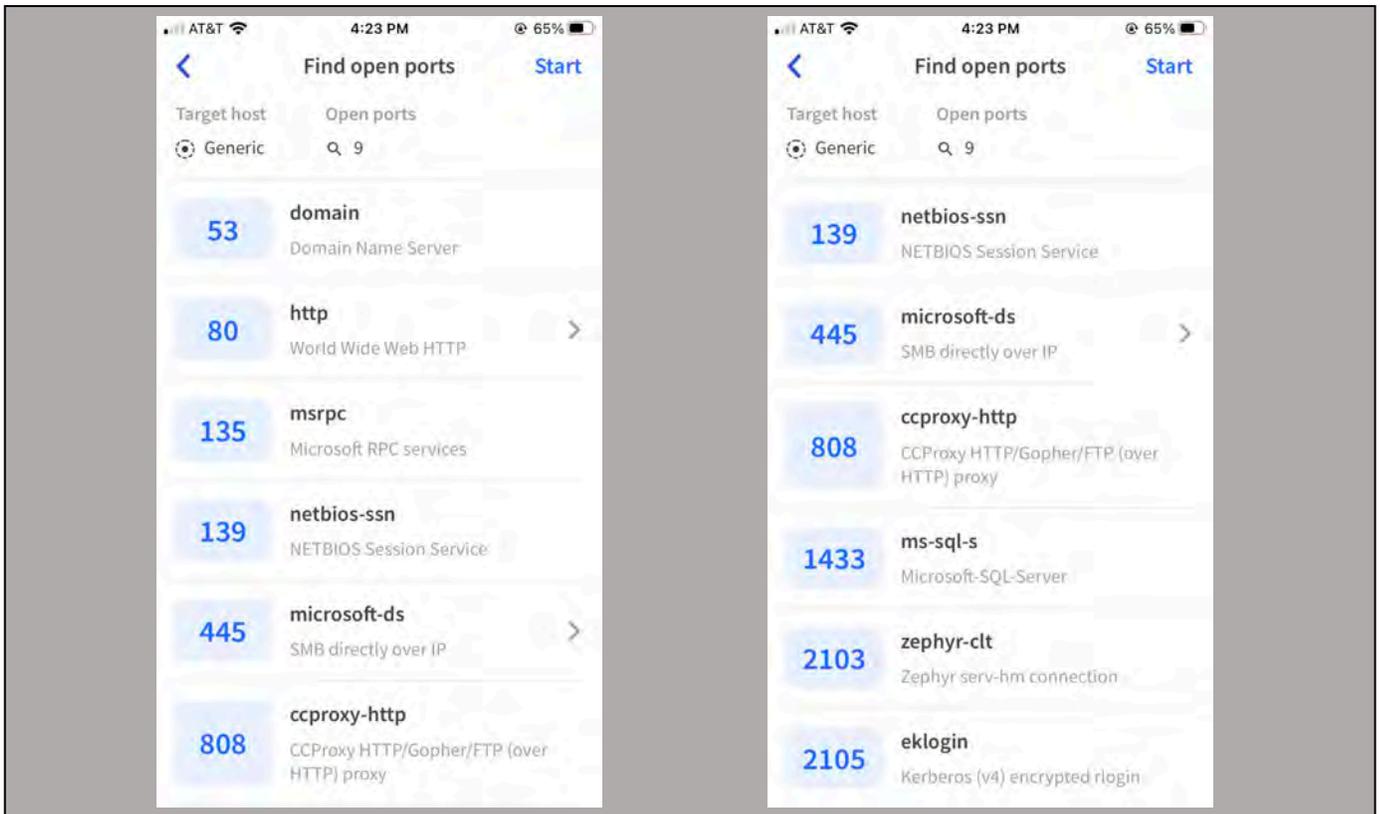

Figure 53 - Scanner Results

> **The iPhone app lists all the ports that it sees open on the EMS server. Port "1433", which the app indicates is associated with "Microsoft-SQL-Server," Is immediately detected.**

In Figure 53, left, one can see the first 6 of the 9 open ports on the EMS server with a wireless access point connected. On the right, scrolling down the screen reveals the remainder of the 9 open ports identified. The SQL service port, 1433, has been identified as operating and configured on this device.

Using the method recommended by CIS (Nmap[71]), a device that offers the Microsoft SQL Service has been identified. This uses standard networking software that many IT professionals and most IT Security professionals are very familiar with.

Whether such an exploitation of technology is performed with the single-response ping command or by using a more powerful tool like Nmap, the discovery of a network connected device on the same network segment has been accomplished.

---

[71] Network Mapper (Nmap) is a tool for network exploration or security auditing, frequently used by cybersecurity penetration testers to find live / operating devices and hosts on networks, perform port scanning, detect operating systems and versions in use, and ping networks and subnetworks to diagram potential and available communication paths.
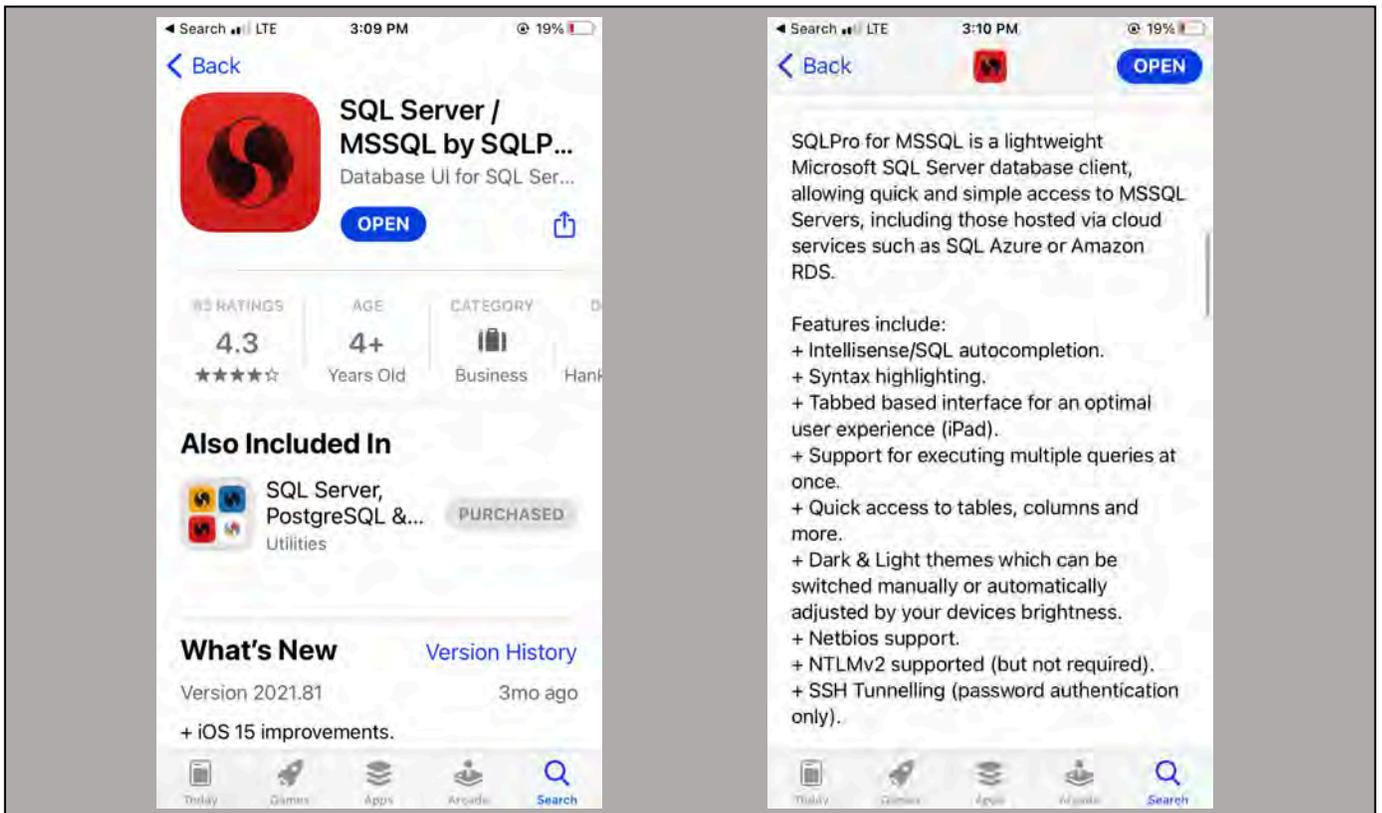

Figure 54 - SQL Access Functionality

> **Returning to the Apple App Store, a search for 'SQL Server' finds another app, 'SQL Server by SQLPro'. The description shows that it is a Microsoft SQL Server database client.**
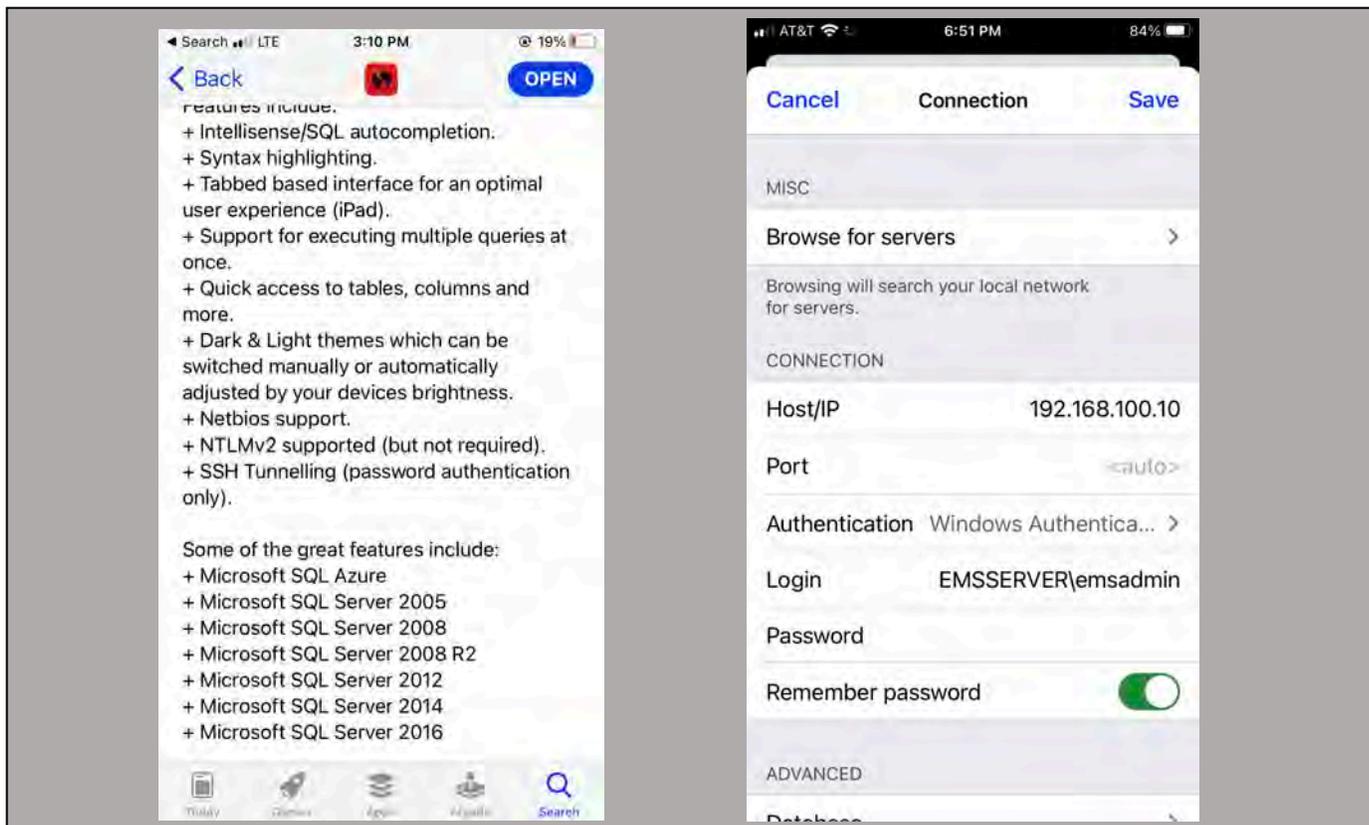

Figure 55 - SQL Pro Capabilities

On the left, the app description shows that it supports Microsoft SQL Server 2016, which is the exact version used by the EMS server. On the right, we use the same IP address, username, and password applied from the iPhone app as previously used to access the EMS server, physically sitting in front of its screen.
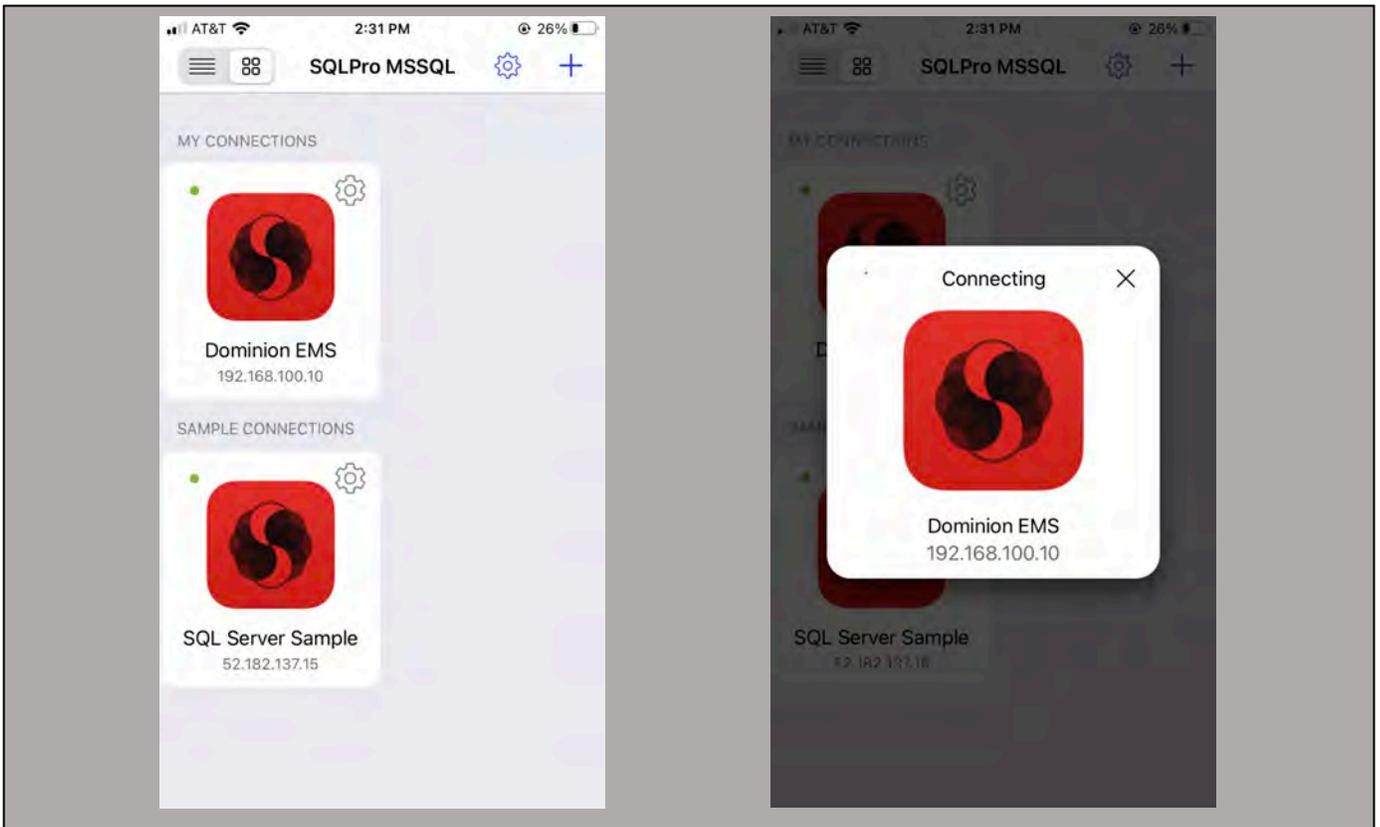

Figure 56 - Making an SQL Connection

The left image shows the configured connection to the EMS server. The right image shows the iPhone connecting directly to the database on the EMS server.
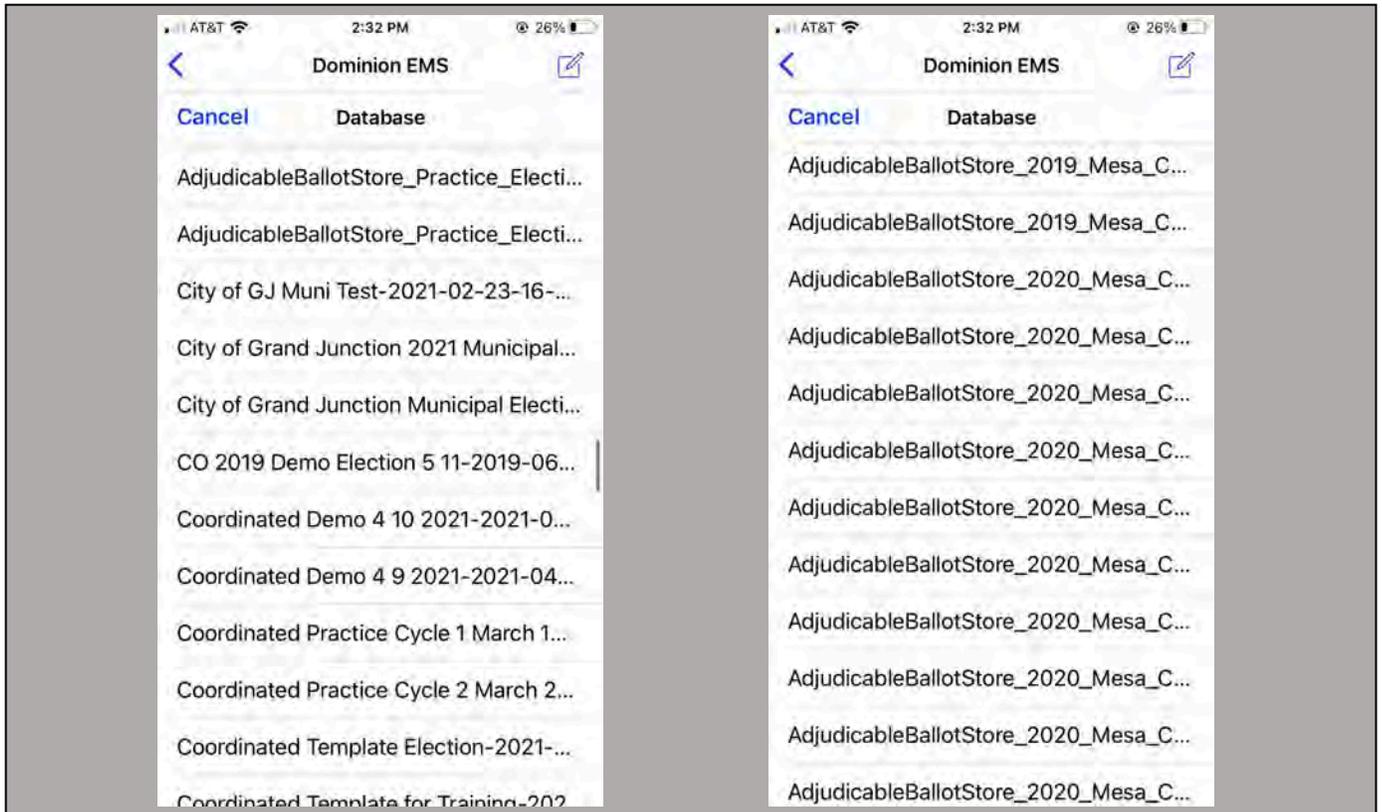

Figure 57 - iPhone Connection to Dominion EMS Database

After a second, the app lists all the voting system databases, just like it did on both the EMS server and on the Test Workstation.
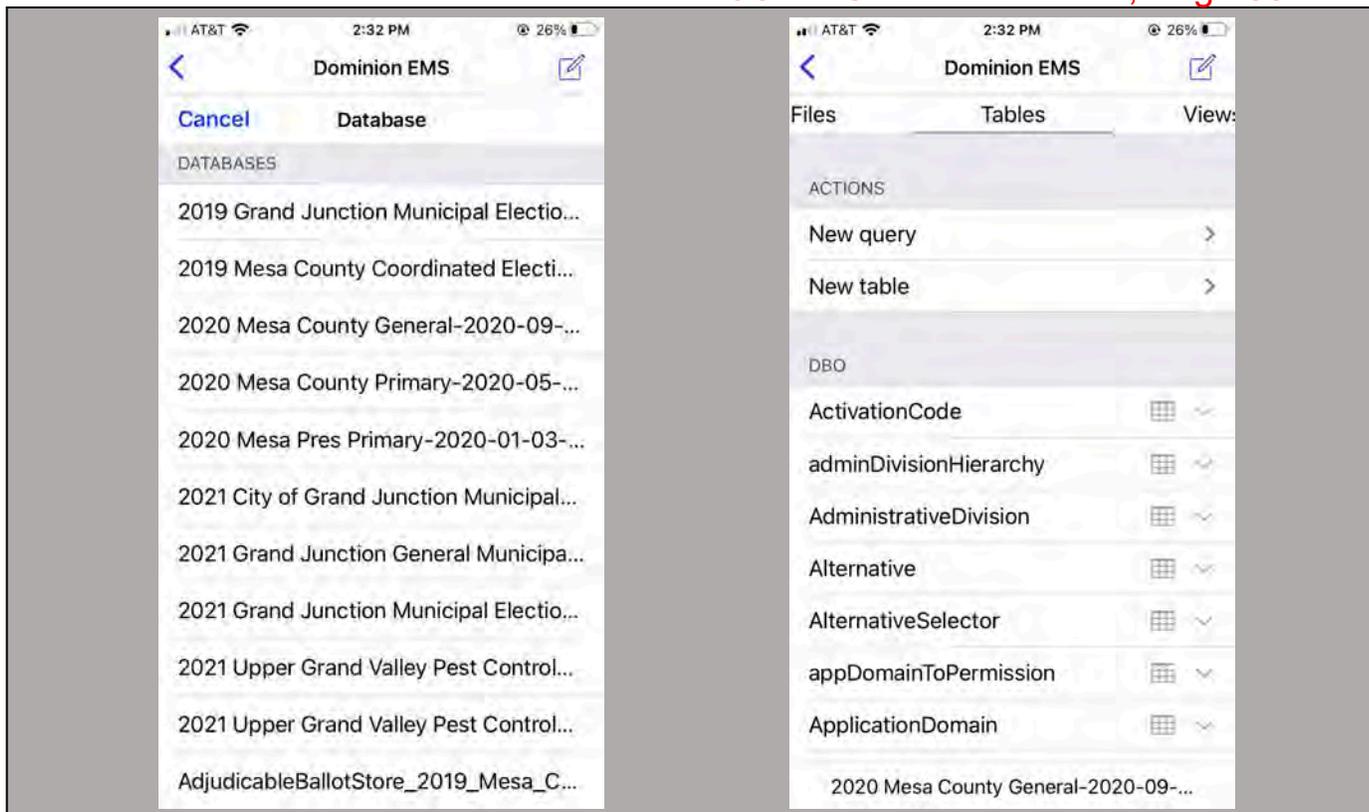

Figure 58 - Databases listing, Continued

Multiple Tabulation Store databases are shown on the left. Next, the 2020 Mesa County General election was chosen from the top of the list, and the image on the right shows the resulting screen, listing the tables in that particular database. So far, the examiner has not been denied access or even experienced a warning of any kind.
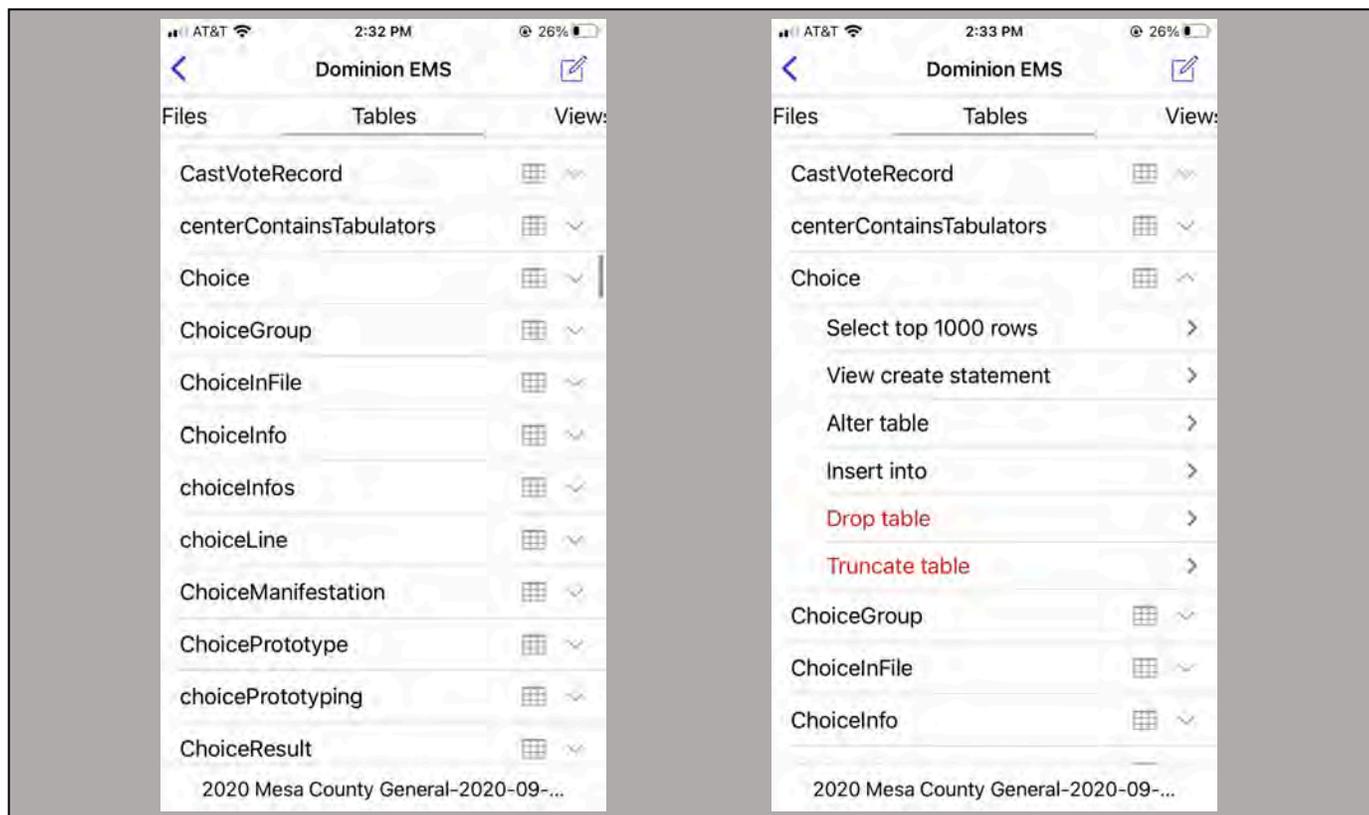

Figure 59 - Database Table Listing

> On the left, one sees the same 'Choice' table as was seen on the EMS server and Test Workstation (where it was called 'dbo.Choice'). On the right, 'Choice' table is selected resulting in the options as shown. I selected 'Select top 1000 rows'.

Note that the "drop table" command would delete the table entirely, while the "truncate table" command would shorten the table, and if applied to a table containing actual vote data, would delete some of those votes.
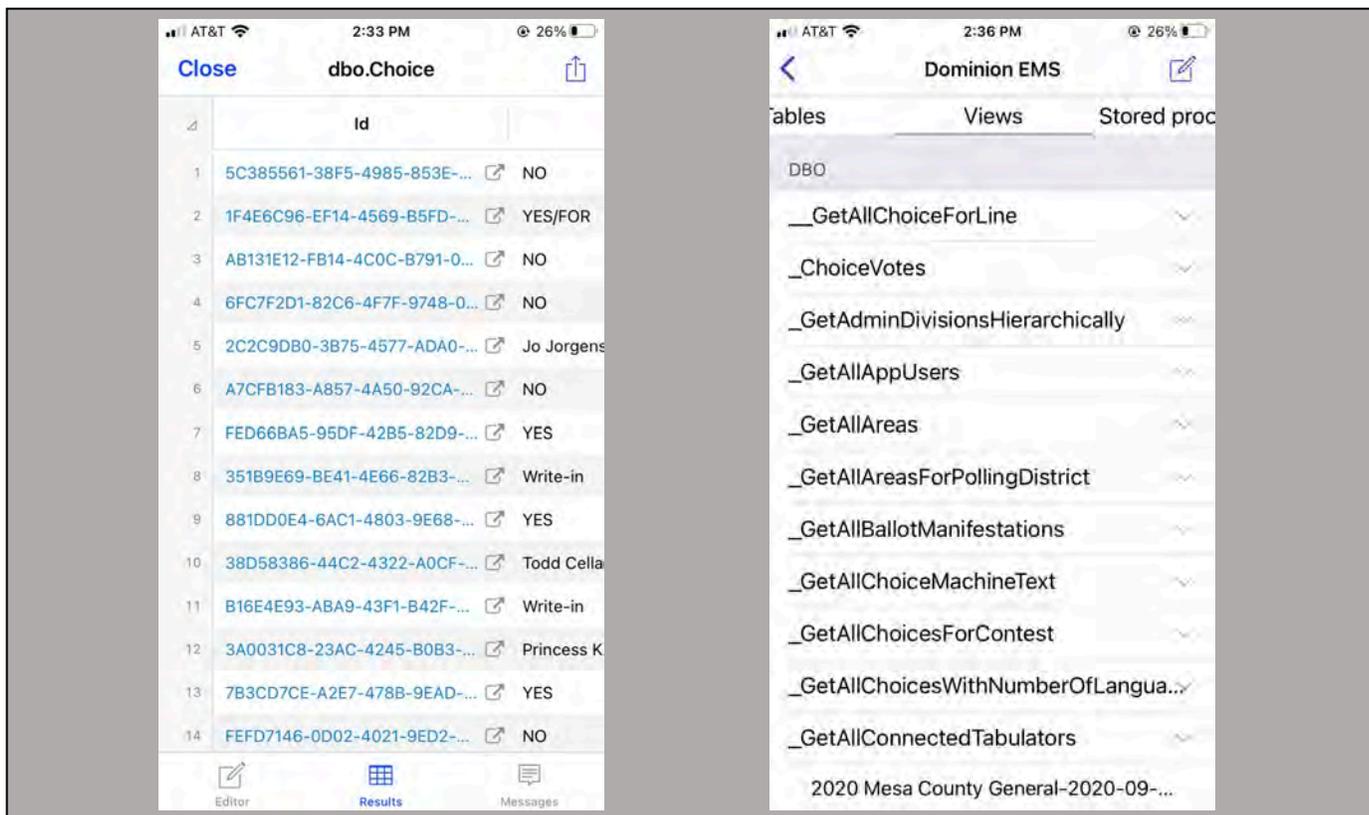

Figure 60 - Database Access

On the left, one sees the top 177 rows in the 2020 Mesa County General database, along with the choices listed as shown by both the EMS server and the Test Workstation. One the right, 'Views' at the top menu was then selected to pull up the database views from the EMS server.
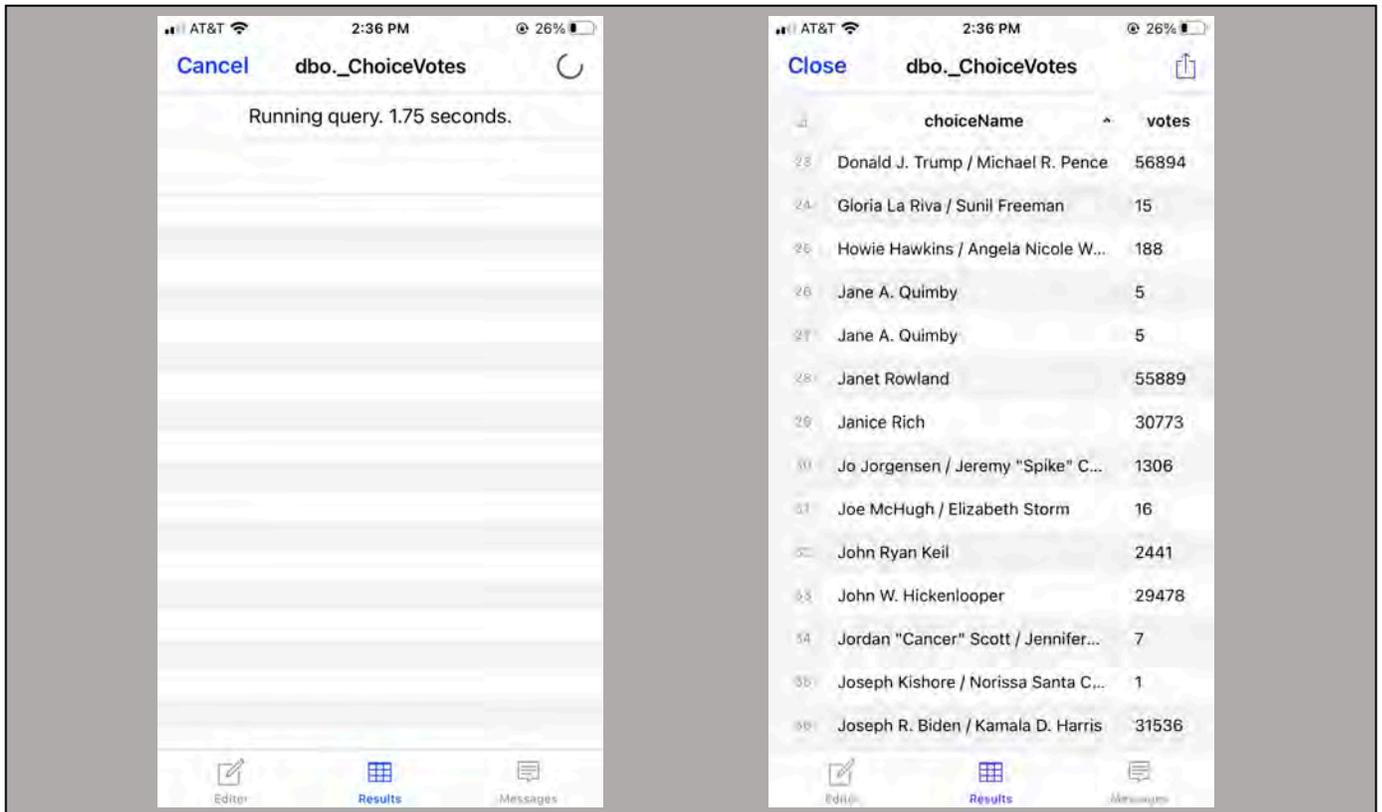

Figure 61 - Executing a Database Query

The _ChoiceVotes view was selected. On the left, one sees that it took 1.75 seconds to pull up all the votes for each choice in the election. The result of that query is shown on the right.
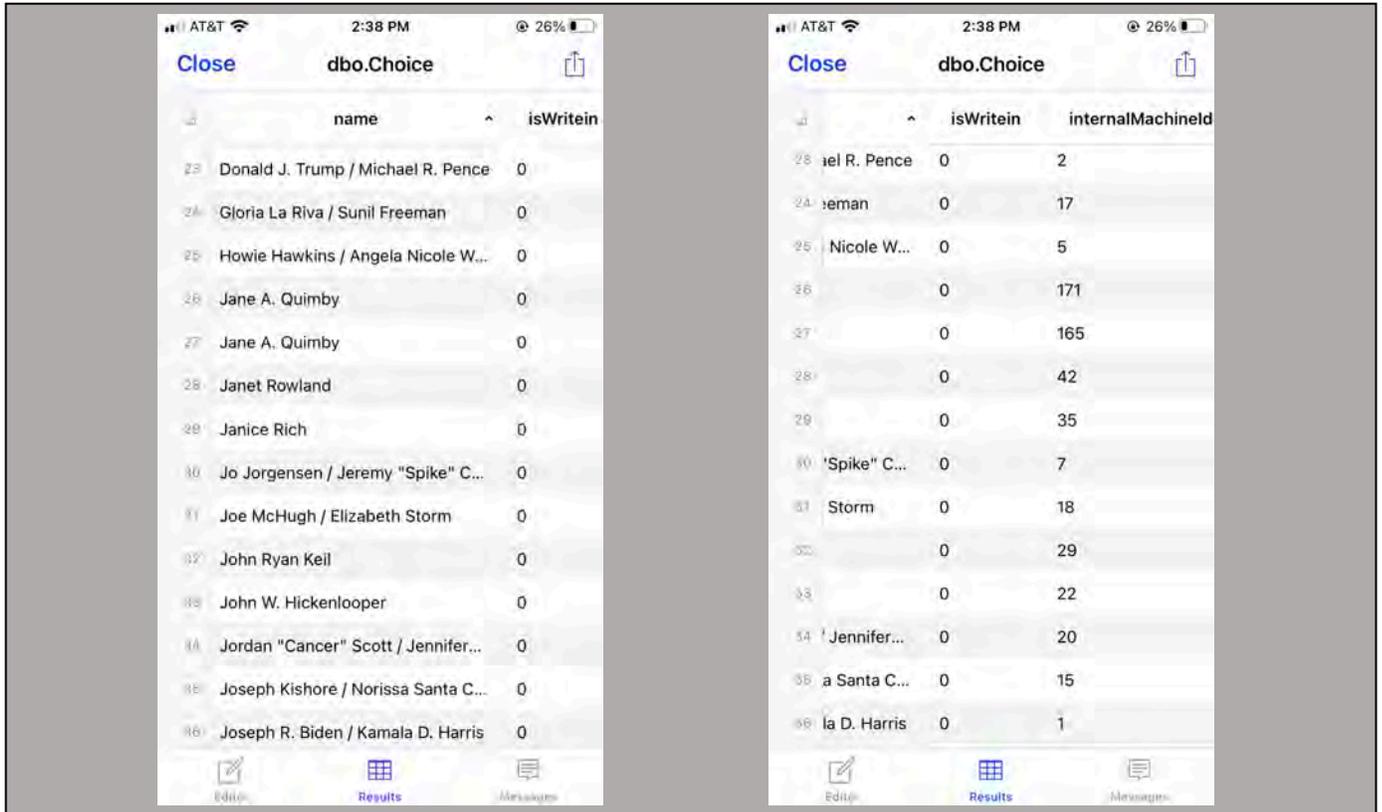

Figure 62 - Table Data

The left and right images demonstrate the effect of scrolling to the right, to display all the columns. All the columns in this table can be viewed without being denied or without any type of warning.

Figure 63 - A script to change the vote data

The left image shows the default query that asks for the SQL Server to send the top 1000 rows from the dbo.Choice table. The instructions on the image on the right were then typed in. What they do is very simple: They update the Choice table by setting the internalMachineId to '1' for 'Donald J. Trump / Michael R. Pence,' and setting the internalMachineId to '2' for the entry with 'Joseph R. Biden / Kamala D. Harris' in it. This is the same type of change that was made by hand on both the EMS server and the Test Workstation earlier in this report.
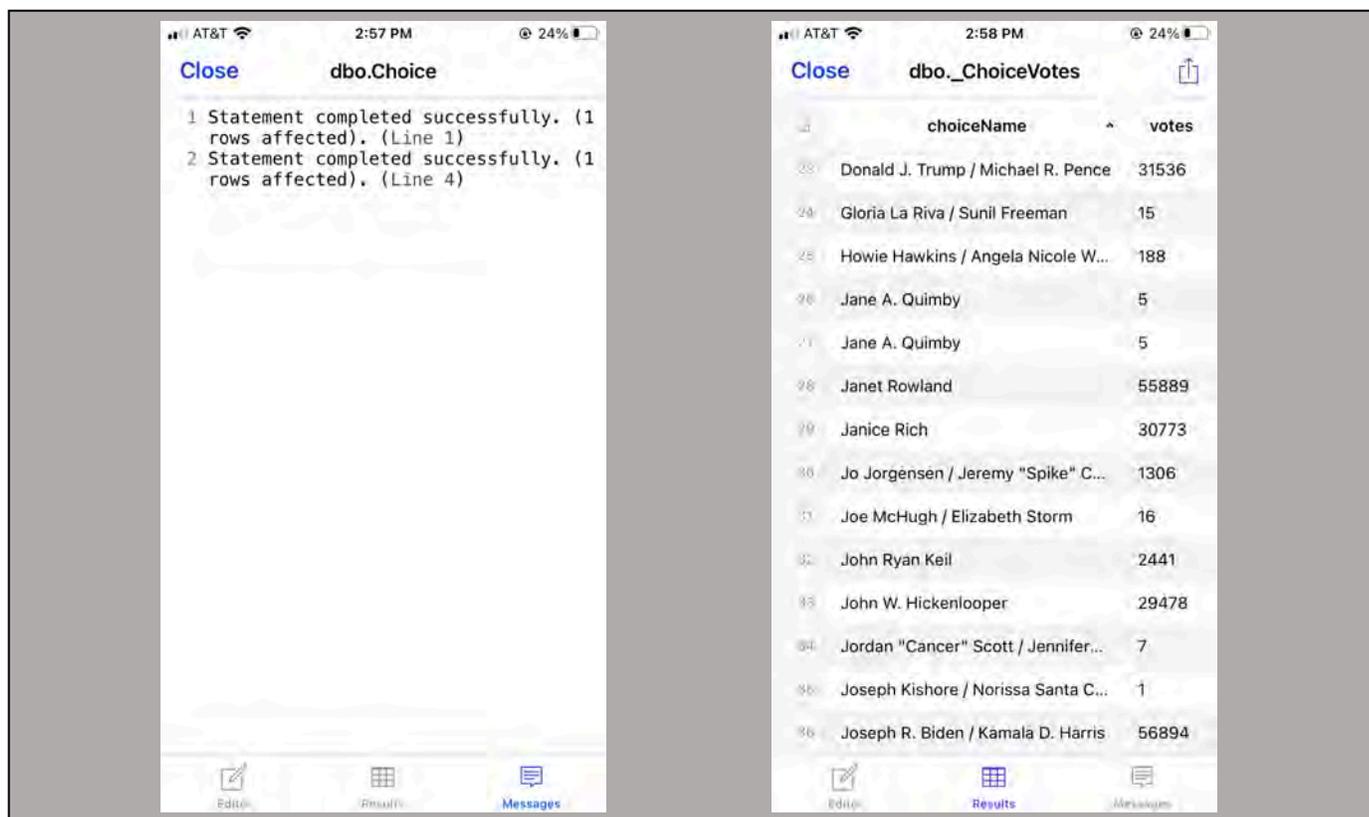

Figure 64 - Script Results

The image on the left shows the typed instructions were executed and the EMS server reported that each instruction was completed successfully, affecting one row each. On the right, the _ChoiceVotes view is run again to see that once again the election results were flipped from Trump to Biden, using a basic iPhone with an app downloaded from the App Store that anyone could install and use.

EXAMINATION RESULT 3:

The calculated vote totals in an EMS server database can be altered by any person using the more limited capabilities of a mobile device wirelessly connected to the EMS server network.

For the iPhone test, while a wireless device was added to the network to allow this demonstration to occur, it's alarming that's all it took to accomplish this, especially since thirty-six devices in the Mesa DVS hardware had wireless cards installed. Anyone could purchase a wireless device like this online or at most computer or office supply stores, attach it inside the voting center, and use one of the easy to guess or well-known passwords on the system (or obtain it from the Darkweb,[72] or access the iDRAC remote control server, or use DVS-published default passwords, etc.), could sit out in the parking lot and change any part of the database before, during, or after an election. More dangerous, since thirty-six devices in the DVS D-Suite System were configured with a wireless card, the same abuse could be committed by someone with basic computer networking skills,[73] given wireless access to the EMS server is completely insecure, exposed to access, protected by only a Windows password, despite many additional protections being available. As an example, a Dell Wireless 1560 internal wireless adapter *was* identified in the specified configuration on the DVS D-Suite ImageCast Voter Activation (ICVA) computer that is part of the Mesa County DVS D-Suite system. A skilled individual could easily get away with this same unauthorized access and much more with almost any modern cell Phone, iPhone or Android, Mac, or PC. Wireless capability is very small today, easily fitting inside a small USB device, which could even be inserted in an internal port, invisible to County officials, allowing for the surreptitious connection of the capability in such a manner that only highly trained specialists would be able to find it. Figure 65 depicts such a miniaturized wireless USB device, which could be installed without notice on a motherboard of the type used by D-Suite EMS servers (shown).
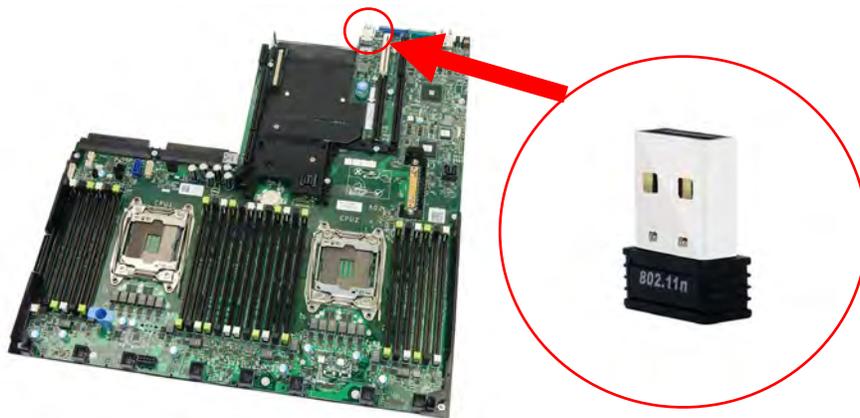

Figure 65 - Small Wireless Device Surreptitiously Installed (internally) on a Computer Motherboard

The result of this examination demonstrates that an attack is possible using a wireless device connected in any one of a multitude of ways. It was possible to perform network scanning using industry standard tools on a common Apple iPhone.

It must be noted that the methods used here are well described in publicly-available, commonly-known literature. Cybersecurity industry guides [74] describe the Nmap application specifically to identify

---

[72] The Darkweb is a clandestine, encrypted, anonymized webserver infrastructure characterized by extensive criminal activity including trafficking in computer access credentials (passwords) as well as many other criminal activities. Access to the Darkweb is only available through use of The Onion Router (TOR) which hides and renders untraceable (to most searches and searchers) the IP address and location of its users. Content on the Darkweb is hidden from the general Internet to facilitate criminal activity.
[73] https://papers.mathyvanhoef.com/ccs2017.pdf, http://www.krackattacks.org/
[74] https://attack.mitre.org/techniques/T1046/

connections to the network. Nmap uses the ICMP 'echo request' command, just as our previous check did using the 'ping' command. Nmap is capable of executing many echo requests in parallel to more rapidly identify the devices connected to a network than the single-request ping program can, and Nmap tests all of the port numbers configured to be tested, for each IP address being tested.

The report in this examination does not reveal any secret tradecraft, or compromise election security; the techniques used in this examination are common among IT professionals. Unfortunately, there is very little security in this voting system, to begin with.

This examination demonstrates how the use of wireless networking can be easily exploited and documents the risk presented using one example. Given the ease with which it can be implemented if wireless devices are enabled (e.g., by an accidental button press on a laptop), it is important to acknowledge the risk so that future elections can be properly protected. To assure integrity of the infrastructure, computing devices with wireless network capability must not be used because wireless networking can be easily enabled by accident (or maliciously). Additionally, certification under VSS absolutely required steps to have been taken within the voting system design and implementation that secure the system from accidental or malicious connections to other networks. The fact that these steps were not taken casts doubt on the credibility and competence of the vendor, the certification authority, the certification testing lab, and the institutions responsible for the testing lab accreditation program.

Making use of the broadband modem inside the cell phone, it may be possible to create a connection from the internet directly into the electronic voting system, bypassing all County firewalls and security, allowing someone to command and control it from anywhere in the world.

This would be completely undetectable by election officials, and most, if not all forensic experts.

While critics may assert that it has not yet been proven that any wireless device was connected to the Mesa County systems and operating prior, during, or after the election, the fact is that wireless devices were installed in Mesa County DVS systems, and critics cannot prove those devices were not operating and exploited. The required compliance standards were created explicitly to provide such proof, yet the features that enable compliance were disabled. Due to the illegal disabling of logging mechanisms, configured overwriting of logs, and the failure to preserve the log data (in violation of the law) that would either show tampering and fraud or support claims of the integrity of the election, it cannot be proven that the election was free of intrusion and tampering (See Report #1).

CONCLUSION

An ongoing forensic examination of the Mesa County EMS server, version 5.11-CO, provided by DVS revealed the overwriting of critical log data and election records, the misconfiguration of logging functions, and the failure to preserve required election records in Report #1.

In this Report #2, the examination has conclusively shown and demonstrated the ability to access election records from a separate computer, not part of the DVS D-Suite system, the ability to edit the election database, and the ability to change calculated vote totals to alter the election results on the Mesa County EMS server entirely, "flipping" the winner of an election contest in the jurisdiction from one candidate to another.

The Key Objectives for this report were answered by this examination:

1. To determine whether D-Suite-implemented security requirements comply with the 2002 Voting System Standards (VSS)
    a. Uncertified software was used on the system rendering the certification of the entire system and all elections conducted with it, Invalid.
    b. Security protections required by law were almost completely absent
        i. Other than a userID and an easily guessed or bypassed password, no authentication was required
        ii. The firewall rule for access to the election database, ballots and results was unrestricted to any IP address in the world
        iii. Together with the firewall rule, Microsoft SQL Server Management Studio (SSMS) enabled complete access to the entire election databases – not just to the 2020 election but to the elections of June 2019 through May 25, 2021.
        iv. A self-signed encryption certificate was used introducing the potential for a man-in-the-middle attack
        v. Thirty-five wireless devices (802.11, Wi-Fi) were installed inside election equipment and an additional wireless device was identified in a connected printer
        vi. Any or all of these wireless devices could have connected to the Internet via the building wireless facilities
        vii. "Purging" (deletion) of critical Audit Log data, as specified by DVS and directed by the Secretary of State[75], destroyed all records of connection to the Internet or elsewhere, all record of user activity, including programs run by these users, errors, and any record of the addition or deletion of votes and the alteration of election results.
    c. **EACH of the compliance failures identified in 1.a. and 1.b. above are clear violations of the law.**

---

[75] The TDP associated with the "trusted build" process is promulgated by the Secretary of State. CRS 1-5-620 States that the vendor provides manuals and documentation and that any information not on file with and approved by the Secretary of State shall not be used in an election.

2. To determine whether the results of an election, stored on the EMS server, can be altered by any person with physical access to the logged-in EMS server,

   a. **Any person with physical access to the logged-in EMS server can change the calculated vote totals on the EMS server.**

3. To determine whether the results of an election stored on the EMS server, can be altered by any person using even a non-Dominion computer directly or indirectly connected to the EMS server network.

   a. **Any person using even a non-DVS computer directly or indirectly connected to the EMS server network can change the calculated vote totals on the EMS server.**

4. To determine whether the results of an election stored on the EMS server, can be altered by any person using a device such as a cell phone wirelessly connected to the EMS server network.

   a. **Any person using a device such as a cell phone wirelessly connected to the EMS server network can change the calculated vote totals on the EMS server.**

Examination of wireless vulnerability required that a wireless device be connected to the EMS server network and demonstrated that such a device when connected is capable of allowing uncontrolled access to and alteration of an election database on the EMS server.

The purpose and the finding of Key Objective 4 demonstrates that if such a wireless device were connected to the EMS server network, the election results can be accessed and altered surreptitiously. The ease with which wireless technology can be enabled, even by accident, presents an unacceptable risk to critical infrastructure voting systems, especially when combined with the egregious violations of the VSS and the multiple security failures found in this examination. **Wireless encryption is easy to break,[76] has been broken, documented and demonstrated online.[77]**

The disabling and mis-configuration of numerous security measures as found in this Examination renders this EMS election system unsafe and utterly insecure. Unauthorized software, multiple violations of VSS and consequently Colorado law and the use of an un-accredited testing laboratory made the certification of this system, and its subsequent use in elections, illegal.

The on-going examination found that security provisions on the election equipment were not restricted by IP address but rather the firewall configuration was programmed to allow any IP address from anywhere in the entire World to access the election records with no more than a single and relatively simple password to protect it.

There is nothing secret or novel about the techniques used to demonstrate direct access, access by a non-DVS computer or iPhone access to the election databases. Software accessible to hundreds of millions of people and openly advertised for free download and use was used to demonstrate the extreme insecurity of the voting system.

---

[76] http://cve.mitre.org/, supra note 18
[77] https://papers.mathyvanhoef.com/ccs2017.pdf, http://www.krackattacks.org/

The reason for the insecure configuration of these critical infrastructure-designated voting systems, in contradiction to the vendor's claims[78] and the Secretary of State's certification, should be determined through appropriate investigation.

The law requires the retention of election records including system logs but this election system is grossly out of compliance with the law. Combined with the overwriting of log files, the systematic disabling of critical logging and numerous security elements disabled or bypassed, creating a "back-door" for malicious actors, this configuration of the Mesa County, Colorado voting system assures that may not be possible to prove the integrity of any election in which this equipment was used. This voting system is not compliant with the law, should never have been used in an election, and cannot be trusted to provide authenticated, reliable election data in any election.

Nearly every point of examination has revealed the most serious deficiencies in both security and configuration.

The claim that "election systems were not connected to the Internet" has been made, however the use of removable media devices, presence of wireless networking components within DVS components, use of the internet for election results reporting and other functions, and the destruction of and non-retention of critical logs prevent the verification that the system was not connected to the internet. The configuration of logging to ensure overwriting of log data resulted in operating system logs not being retained that may have shown any improper activity, had it occurred. Because of this it is not possible, on the basis of election systems log files (that are required to be retained), to prove election tampering or election integrity.

This failure of the voting system to retain log files that could prove election integrity is a most serious violation of certification requirements. The voting system, having not met election certification requirements, could not have been legally authorized for use in an election.

This report has detailed the following critical discoveries in Mesa County's voting system:
- **Uncertified software installed, rendering the voting system unlawful for use in elections.**
- **Does not meet statutorily mandated Voting System Standards (VSS) and could not have been lawfully certified for purchase or use.**
- **Suffered systematic deletion of election records (audit log files required by Federal and State law to be generated and maintained), which, in combination with other issues revealed in this report, creates an unauditable "back door" into the election system.**
- **Violates Voting Systems Standards ("VSS") which expressly mandate prevention of the ability to "change calculated vote totals." This report documents this non-compliance from the logged-in EMS server, from a non-DVS computer with network access, and from a cell phone (which may be possible if any of the 36 internal wireless devices in voting system components are deliberately or accidentally enabled and a password is obtained).**
- **Mandatory VSS "System auditability" required features are disabled.**
- **Is configured with 36 wireless devices, which represent an extreme and unnecessary vulnerability, and which may be exploited to obtain unauthorized access from external devices, networks, and the Internet.**

---

[78] See Appendix A. Compliance Requirements.

- **Is configured through firewall settings to allow any computer in the world to connect to the EMS server.**
- **Uses only a Windows password with generic userIDs to restrict and control access.**
- **contains user accounts with administrative access that share passwords, subverting VSS-required user accountability and action traceability controls.**
- **Uses a self-signed encryption certificate which exposes the system to the risk of undetected compromise or alteration.**

This report does not compromise state secrets or election integrity – that has already been done by these multiple violations of law, multiple failures of the vendor, the Voting System Testing Lab and the Secretary of State's improper certification. Nation-state adversaries already know these vulnerabilities exist; it is only the American people that are unaware. No new vulnerabilities are discovered or disclosed in this report; all of them are previously well known in the industry and to professionals.

Immediately pending elections and the complete lack of election integrity presented by this voting system present an extreme danger to our constitutional republic. With elections beginning on a large scale very soon, with the massive security vulnerabilities, the weakness presented by this uncertifiable Voting System, the abject failure of the Voting System Testing Laboratory with expired accreditation and lack of proper oversight by authorities, remediation of these issues before pending elections is not possible.

This DVS election system has been shown non-compliant with the law and has been shown to be uncertifiable. The use of this system in an election was itself a breach of law, and more importantly a breach of public trust with reckless disregard for the right of a free people to choose their government.

APPENDIX A. COMPLIANCE REQUIREMENTS

Standards for election systems are provided by the Federal Election Commission Voting Systems Standards (VSS) and in Colorado, compliance is required with this standard.

The VSS requires access control to prevent or detect access to election systems, ensure that system functions are executable only in the intended manner and order, provide safeguards to prevent tampering, record and report the date and time of normal and abnormal events, maintain a permanent record of all audit data that cannot be modified or overridden, detect and record every event including an error condition that the system cannot overcome, time-dependent or programmed events that occur without the intervention of the voter or a polling place operator, and to protect the system from intentional manipulation and fraud, among many other requirements.

Federal Election Commission 2002 Voting Systems Standards (VSS)

Specific compliance requirements from the 2002 Voting Systems Standards (VSS) documentation are excerpted in this section. The Standards are contained in 2 volumes which together are several hundred pages long, and are published on the Federal Election Commission website as two PDF documents.

Excerpts in this Appendix are cited by VSS Volume, Section and Page number for reference in the first line of each box, followed by text of the VSS. Discussion of these standards follows outside each text box as appropriate.

APPLICABILITY

VSS V1, 1.6, page 1-13:

The Standards apply to all system hardware, software, telecommunications, and documentation intended for use to:

- Prepare the voting system for use in an election;
- Produce the appropriate ballot formats;
- Test that the voting system and ballot materials have been properly prepared and are ready for use;
- Record and count votes;
- Consolidate and report votes;
- Display results on-site or remotely; and
- Maintain and produce all audit information.

In general, the Standards define functional requirements and performance characteristics that can be assessed by a series of defined tests. Standards are mandatory requirements and are designated by use of the term "shall".

All of these functional requirements are important. In this report we focus on aspects of recording and counting votes. Determination of whether the election management system performed with the accuracy and integrity required by these standards requires the audit information be maintained and preserved in accordance with law. The VSS is applicable the DVS D-Suite systems examined and reported upon in this document and in Report #1.

VSS V1, 2.1, page 2-19:

This section contains standards detailing the functional capabilities required of a voting system.

[…]

- Overall Capabilities: These functional capabilities apply throughout the election process. They include Security, accuracy, integrity, system auditability, election management system, vote tabulation, ballot counters, telecommunication and data retention.

The VSS is written specifying capabilities required at a high level. Detailed implementation methods are not specified but it is clear, for example, that these topics are not to be ignored.

VSS V1, 2.2, page 2-20:

This section defines required functional capabilities that are system-wide in nature and not unique to pre-voting, voting, and post-voting operations. All voting systems shall provide the following functional capabilities:

- Security;
- Accuracy;
- Error Recovery;
- Integrity;
- System auditability;
- Election management system;
- Accessibility;
- Vote tabulating;

The emphasis on all of these functional capabilities together indicates the serious nature of the requirement in this standard. The declaration by the U.S. Government that these systems are part of the national critical infrastructure further reinforces the importance of these capabilities. "Shall provide" indicates the mandatory nature of the requirement. The implementation of a functional security capability does not mean to apply the weakest possible implementation of security, for example.

DATA RETENTION

VSS V1, 2.2.11, page 2-34:

United States Code Title 42, Sections 1974 through 1974e, states that election administrators shall preserve for 22 months "all records and paper that come into (their) possession relating to an application, registration, payment of poll tax, or other act requisite to voting." This retention requirement applies to systems that will be used at anytime for voting of candidates for Federal offices (e.g., Member of Congress, United States Senator, and/or Presidential Elector). Therefore, all systems shall provide for maintaining the integrity of voting and audit data during an election and for a period of 22 months thereafter.

[…]

The appropriate state or local authority must preserve all records that may be relevant to the detection and prosecution of federal civil rights or election crimes for the 22-month federal retention period, if the records were generated in connection with an election that was held in whole or in part to select federal candidates.

This requirement is clear. In discussion of retention of "all records that come into their possession" the burden of understanding what a record is, falls on election administrators. In particular this standard specifies that state or local authority must perform the preservation of all records.

Election Record Definition, Scope and Content

VSS V1, 4.4.3, page 4-84:

In-process audit records document system operations during diagnostic routines and the casting and tallying of ballots. At a minimum, the in-process audit records shall contain:

a. Machine generated error and exception messages to demonstrate successful recovery. Examples include, but are not necessarily limited to:
   1) The source and disposition of system interrupts resulting in entry into exception handling routines;
   2) All messages generated by exception handlers;
   3) The identification code and number of occurrences for each hardware and software error or failure;
   4) Notification of system login or access errors, file access errors, and physical violations of security as they occur, and a summary record of these events after processing.

Other exception events such as power failures, failure of critical hardware component, data transmission errors, or other type of operating anomaly;

Documenting computer interrupts is a very detailed requirement, from a computer science perspective it is considered extreme. In normal operation, logs of computer activity typically do not include this level of detail unless the generation of records (logging) is set to the most verbose level for software debugging, because the volume of log data generated can be extreme. The specification that these records are

generated during diagnostic routines as well as during the counting and tallying of the vote, in the same sentence, is illuminating and indicates that the intention of the VSS is that this most extreme level of record be generated especially in the 4th example listed in this standard.

It is instructive to note that this standard specifically enumerates these requirements within the definition of a record, rather than in the section that specifically addresses security:

- System login;
- System access errors;
- File access errors; and
- Physical violations of security as they occur,

One reason that file access errors are included in this definition is that programming and operational errors can result in the creation of errors in stored data (that manifest in file access errors). Another reason is that intruders were well known at the time this standard was written and before, to attempt to destroy evidence of their activities by deleting audit trail records that might tend to incriminate them. Title 18, Sec. 1030 makes unauthorized access to such a computer system a felony.

In other election cases such as the Antrim, Michigan case it is notable that while records of previous elections were preserved and still on the election system, the audit records from the 2020 election were missing; the fact that records were generated and preserved previously but suddenly stopped during a specific event where malfeasance is suspected is significant and indicative of the practice by intruders to delete any record of their activity.

Astronomer Cliff Stoll became famous as an early computer crime investigator and published a book entitled "The Cuckoo's Egg" in which he recognized that computers don't make mistakes – programmers do. As a consequence, he looked at the very records regarding exception handling and errors that are required in this standard, because accounting software on the computer he managed as a grad student reported a 25-cent error in accounting data. Cliff's curiosity and persistence resulted in the discovery of a computer attack where the intruder tried to delete audit records that resulted in the error. The investigation ultimately revealed international espionage and attacks against the US Government that would have gone unnoticed without his analytical search for what he initially assumed was a programming error. As a pattern of evidentiary finding, this history is very useful in understanding computer crime and criminal behavior.

This inclusion of these security-specific requirements in this basic but over-arching definition indicates their importance and that the intent of the standard is for great detail in the generation of these specific security audit records.

Security Requirements for Voting Systems

VSS V1, 6.1, page 6-93:

[…]

Ultimately, the objectives of the security standards for voting systems are:

- To establish and maintain controls that can ensure that accidents, inadvertent mistakes, and errors are minimized;
- To protect the system from intentional manipulation and fraud, and from malicious mischief;
- To identify fraudulent or erroneous changes to the system; and
- To protect secrecy in the voting process.

The Standards are intended to address a broad range of risks to the integrity of a voting system. While it is not possible to identify all potential risks, the Standards identify several types of risk that must be addressed by a voting system. These include:

- Unauthorized changes to system capabilities for:
  - Defining ballot formats;
  - Casting and recording votes;
  - Calculating vote totals consistent with defined ballot formats; and
  - Reporting vote totals;
- Alteration of voting system audit trails;
- Changing, or preventing the recording of, a vote;
- Introducing data for a vote not cast by a registered voter;
- Changing calculated vote totals;
- Preventing access to vote data, including individual votes and vote totals, to unauthorized individuals; and
- Preventing access to voter identification data and data for votes cast by the voter such that an individual can determine the content of specific votes cast by the voter.

This standard is also clear. The first three bullets in the list of objectives are related as previously explained, because intentional manipulation, fraud, malicious mischief and fraudulent or erroneous changes to the system often manifest in records that appear initially to have been accidents, inadvertent mistakes and errors.

The failure of security identified in this report specifically permitted unauthorized changes to the recording of votes in a database, as components of the database that should have been protected were allowed to be altered. A more difficult to find alteration might involve the changing of ballot formats so that a vote for one candidate appeared as a vote for a different candidate, but the access granted by the failure of security access controls allowed full administrative access to the database. The changing of calculated vote totals was specifically demonstrated by the tests in this examination. The data values changed essentially mean "Trump's votes are stored here -> X" and "Biden's votes are here -> Y" and the test switched X and Y.

As presented in Report #1, audit trails were altered (deleted) because the specifically enumerated risk was not addressed as required by this standard.

> VSS V1, 6.2, page 6-96:
>
> Access controls are procedures and system capabilities that detect or limit access to system components in order to guard against loss of system integrity, availability confidentiality and accountability. Access controls provide reasonable assurance that system resources such as data files, application programs, and computer-related facilities and equipment are protected against unauthorized operation, modification, disclosure, loss, or impairment. Unauthorized operations include modification of compiled or interpreted code, run-time alteration of flow control logic or of data, and abstraction of raw or processed voting data in any form other than a standard output report by an authorized operator.

Access control capability was built into the EMS server operating system and into the SQL DBMS but not programmed to be secure and one most egregious finding was that the EMS server was specifically configured to be insecure in defiance to the requirements in this standard and every known industry, government and security best practice, the standards of the National Institute of Standards and Technology (which chaired the committee that produced the VSS), and the DoD Security Technology Implementation Guides.

> VSS V1, 6.2.2, page 6-97:
>
> Vendors shall provide a detailed description of all access control measures designed to permit authorized access to the system and prevent unauthorized access. Examples include:
>
>   a. Use of data and user authorization;
>   b. Program unit ownership and other regional boundaries;
>   c. One-end or two-end port protection devices;
>   d. Security kernels;
>   e. Computer-generated password keys;
>   f. Special protocols;
>   g. Message encryption; and
>   h. Controlled access security.
>
> Vendors shall also define and provide a detailed description of the methods used to prevent unauthorized access to the access control capabilities of the system itself.

This standard requires a detailed description to be provided by the voting system vendor, but clearly expects these functional protections to be implemented if the measures are to be documented.

DVS stated on their website [79] that they are compliant with voting systems standards, including the Voluntary Voting Systems Guidelines (VVSG) as shown in Figure 66. A review of the VSTL test-related documents reveals that the standards tested against were the VVSG standards. By comparing the test plans and reports to the requirements in the VVSG, this is easily assessed.

Dominion Voting Systems is committed to ensuring the security of elections.

We utilize both voluntary and compulsory testing on every one of our systems as part of company and federal/state certification processes. Our Democracy Suite products have been tested and certified by the U.S. Election Assistance Commission (EAC) in accordance with federal Voluntary Voting Systems (VVSG).

Figure 66 - DVS Compliance Statement

The Voluntary Voting Systems Guidelines (VVSG) contain even more explicit and precise definitions of the logging required than do the VSS, and although these are Guidelines that are not explicitly required under Colorado law, DVS makes the claim on their website that they are compliant with them. The 2005 VVSG were a defacto standard for the security of election systems and have been revised several times. The 2005 VVSG specifically requires in section 2.1.5.1 that a number of safeguards and operational requirements be applied. The VVSG excerpt below is *only a small partial list of those requirements*, but for this examination, the finding of key compliance issues is noted in Red following each requirement:

a. Voting system equipment shall record activities through an event logging mechanism.
   FAIL. Log mechanism does exist and records some, but not all activities, even though it overwrites and destroys those records frequently. Logging is not only incomplete but is wholly inadequate.

b. Voting system equipment shall enable file integrity protection for stored log files as part of the default configuration.
   FAIL. Not only have log files not been preserved, but they have been overwritten as indicated in Report #1. Further, the log file size has been set to a very small limit such that the log data is NOT preserved and cannot be recovered historically. Integrity Protection for these log files is not implemented.

c. The voting system equipment logs shall not contain information that, if published, would violate ballot secrecy or voter privacy or that would compromise voting system security in any way.
   FAIL. The log files that remain contain very little information of value in determining the integrity of the election at all; no information was found in the logs that can violate the secrecy of ballots or voter privacy, or that would compromise voting system security, but critical Audit Log data has been deleted (overwritten and in some cases its collection disabled) that is required for an Audit of the system's security, integrity, accuracy, that would identify errors, malicious actions, illegal tampering with ballots and vote totals, intrusions, what programs

---

[79] This statement was present on Dominion Voting Systems' website in September, 2020 and has since been removed, however the claim that they comply with voluntary VVSG standards brings this into relevance.

were run, by whom, and their results. Contrary to the law, this is not in compliance – it is just the opposite: voting system security is compromised by the inability to detect malicious activity.

d. The voting system equipment shall log at a minimum the following data characteristics for each type of event: 1) system ID; 2) unique event ID and/or type; 3) timestamp; 4) success or failure of event, if applicable; 5) User ID trigger the event, if applicable; 6) Resources requested, if applicable.

FAIL. The EMS system does not record this information and in most cases has been configured by the Manufacturer to not log this information.

e. Voting system equipment shall log all events, including abnormal events.

FAIL. The disabling of logging and the overwriting of log files above a certain size prevent the logging of all events.

f. Voting system equipment shall ensure that event logging cannot be disabled. Voting system equipment shall implement default settings for secure log management activities, including log generation, transmission, storage, analysis and disposal.

FAIL. The design and configuration of this voting system provides exactly the opposite. Logging has been disabled by design and by the misconfiguration of the operating system such that the required and necessary records are NOT stored.

g. Voting system equipment shall log clearing of logs and log rotation.

FAIL. The EMS system does not log the clearing of logs or log rotation, nor the overwriting of files (an act of "clearing the logs"). No record of log rotation could be found. In Report #1, the vendor DVS not only overwrote the operating systems and all log data with its "Trusted Build" installation, it designed the installation process to re-format and re-partition the hard disk ensuring that this occurred.

Of particular importance are sections b, d, e, f and g above. Had they been implemented properly and in accordance with the standards as Dominion claims and Customers expect, these log data would have supported conclusions regarding the integrity or the lack of integrity of the election. In both Antrim and Maricopa investigations, the DVS software did not log each modification to each record. Per the VSS, this detail of logging should be not only performed, but retained for 22 months (25 months in Colorado).

Even the Center for Internet Security (CIS) recognizes the need for these controls, among many others, in their Handbook for Election Infrastructure Security.[80]

Given the failure to implement these required and recommended controls, the DVS Democracy Suite version 5.11-CO as provided to the State of Colorado **does not possess the required integrity controls as claimed by DVS and required by law. From the evidence presented in this report, this failure of integrity safeguards means that elections held in Colorado using this equipment do not possess the integrity to protect the vote from tampering, or to record access to or modification of the vote.**

APPENDIX B. DATABASE FUNDAMENTALS

This report addresses computerized databases. This Appendix provides a basic understanding of the terms and technology involved to support the reader's understanding of findings in this report.

The voting systems used in Mesa County, Colorado are made by DVS.   Many of these voting systems are comprised of an industry-standard computer that uses a Microsoft operating system and Dominion application software that provides a foundation for election related functions including capturing and storing the election data in a database management system, tabulating and counting the vote.

The Mesa County Election Management System (EMS) server runs on the Microsoft Windows Server 2016 operating system, and it employs a database management system known as Microsoft SQL Server. The security of the system depends largely upon the proper configuration of the Operating System and the SQL Server.

There are several types of databases, including relational, non-relational, and object-oriented databases. This discussion will be limited to relational databases because this is the type of database used in the Dominion voting system that is the subject of this forensic examination.

Microsoft SQL Server is a Database Management System (DBMS). A DBMS can contain many databases. Within this Mesa County, Colorado EMS server DBMS are many databases from prior elections, in addition to the 2020 General Election. Each database consists of many tables that can have different purposes. Some are administrative (access permissions for example), some are necessary for the DBMS to function (such as the database of databases, necessary because a DBMS can have multiple databases), and some have operational content related to the purpose of the database. This information is contained in multiple Tables consisting of multiple columns (and multiple rows if not empty). The database of databases (referred to as the DBDB) identifies the users, access permissions, the identity of each table that is contained within each respective database, among other items.

The fundamental components of a relational database are Tables, Rows and Columns. Data are organized in tables. Columns within a table contain specific data types, for example, first name, last name, street address, city, state, etc. Rows within a table each contain an instance of the data, referred to in database science as a tuple. The database is called a relational database because the various tables are *Related* by what is known as a KEY value. The Key value exists in multiple tables and is the item that links or *relates* the data in one table to the data in another table. For example, in a voter database, one reasonable KEY value might be Ballot Number – it would exist in all the associated tables and it becomes possible to retrieve ALL the data about a particular ballot by searching for every row where ballot number equals, for example, 300.

One primary purpose of a database is to return data in response to a request for that data, called a Query. One of the most common computer languages used in modern relational databases is the Structured Query Language (SQL). Structured query language is intended to be readable and understood easily.

An example of an SQL-like query might be to find the address of a person in a database table called "Addresses". Such a query might look like:

> RETRIEVE(Addresses) address.street.address, address.city, address.state where first.name="John" and last.name="Smith"

IF the database table has an entry for John Smith, the above query would return the Street Address, City and State for him, *provided that* the user of this database had permission to read this specific Addresses table. While there is a specific order (syntax) for the components of the database command (e.g., a format), the commands are not difficult to understand, and the example here, while similar, is simplified to make it very understandable.

A DBMS implemented in software known as *Microsoft SQL Server* is addressed in this document because it is the DBMS installed and used in the Mesa County Colorado Election Management System server. The function of a DBMS is to organize its tables and rows, to provide a very granular set of permissions to the users of the database, to provide the integrity of the data – specifically to ensure that data cannot be inappropriately altered or deleted, and to control the four basic functions of the database. Four basic functions are implemented in relational databases, with respect to the data contained in its table-rows. Those basic functions are read, write, modify, and delete. The DBMS also supports various types of calculations based on the data in its tables.

One of the features of a DBMS is to very granularly control the permissions within a database. For example, a user might have permission to change the street address within a row, but not be allowed to change the city or state. Normal computer system permissions *without* a DBMS give the user permission to access the entire data set (for example, within a spreadsheet). Thus, the permission settings (e.g., configuration) of a DBMS are critical to its proper functioning and the ability to maintain integrity of the data within the database. These permission settings control who can perform which transactions.

Permissions within a well-controlled database specify which users can read which tables, which users can add data to the table, which users can modify (or update) data in the table, and which users can delete data in a table. Most commonly only the DBMS administrator has all four permissions for any table. It is common for an average user to be able to read and perhaps add data to a table, while changing or deleting data requires a supervisor to perform the task. A computer program (or task) can be assigned permission in the same manner that a user can be, sometimes by creating a user-id that is used only by the program.

There are special tables within a database that are highly restricted. These special tables include the DBDB within the DBMS, the User table within each database, the permissions for each user to each database and database table, and in some cases, the permissions for each user to the columns within each table. These special tables define how the DBMS operates.

It is required that a particular user within a DBMS only be able to alter the data with good reason. One example might be the case of a changed vote. Let's consider, for example, a hand-marked ballot, for simplicity, identified as ballot #300. The identity of the voter is not associated with the ballot number so it is accessed only by its number. The ballot contains circles or squares to be marked to indicate a vote. However, if the ballot marking is not within the lines (within limits), the ballot is marked for adjudication so that a human can then take steps to determine the voter's intent and then store that entry in the database. In this example, the original vote (and the photographic image of the ballot) might be stored in a database table called PendingAdjudication (the table name is an example to illustrate the technology). The Adjudication user should be able to read the data in the PendingAdjudication table, but not change or delete it. The user looks at the ballot image and makes their determination of voter intent and the results are written to a separate table called AdjudicatedVote. The user then has permission to change the value of ONE COLUMN within the PendingAdjudication table (for the specific data row) to indicate Adjudicated or NotAdjudicated. The point of the example is that even in this case, the original data is not deleted, and a

separate database table is used to compile the data. The Adjudication user in this example NEVER changes the original data, but the vote that is counted is in the AdjudicatedVote table. Thus, an audit of the complete voter database should show that there is one, and only one, entry for ballot #300, and the decision of the auditor should be available for review and the actions taken should be traceable. A more complex design may even use a separate table all-together to track which items are adjudicated or not.

The design of the database must make sense. In the example above, if the Adjudicator were to be permitted to change the original vote in the PendingAdjudication table, the ability to review their decision would be lost and there would be no way to audit the change, without seeing the before- and after- results. Thus, not only must the configuration of permissions enable those necessary changes but it must protect the integrity of the data and support the ability of the system to be auditable.

There is much not discussed here. For example, the DBMS in a voting application would be expected to check the PendingAdjudication table to make sure that every ballot that was sent to be adjudicated HAD BEEN processed, and that there were no rows with NotAdjudicated remaining, before the tabulation and count of votes had been finalized.

The design of the database and its permissions are only part of the logic required to make such a system work properly. As with the check above to ensure that all votes were adjudicated, there is much additional logic, which should be found within the database processing workflow, to ensure the proper calculations and integrity are maintained throughout the entire voting process.

APPENDIX C. IP ADDRESSING FUNDAMENTALS

There are two versions of Internet Protocol addressing seen in this data. The legacy version of addressing is expressed by four one- to three-digit numbers separated by periods – "X.X.X.X," where X is an 8-bit number (e.g., has a value of 0-255). Because industry and users throughout the world have exceeded the number of available address numbers, a new address scheme was developed. The legacy address scheme is known as IP version 4 (IPv4) and is 32 binary bits long, while the new scheme is known as IP version 6 (IPv6) and is 128 binary bits long, represented as 8 groups of 4 hexadecimal values (0-9 and A-F) separated by periods (A.B.C.D.E.F.G.H). This solves the problem of running out of IPv4 addresses and provides, by one estimate, more than 1,500 IP addresses for every square meter of Earth's surface. This explanation is provided because both types of addresses are present in this forensic analysis and it is necessary for the reader to understand the data being presented.

In Figure 8, IP2 shows the IPv4 address 192.168.100.10, the address assigned to be used by the Mesa County EMS server. IP1 shows the IPv6 address FE80::792B:3E74:DF1B:C565%5. This translates to FE80:0000:0000:0000:792B:3E74:DF1B:C565 (the double colon stands for repeated 0 address values), and "zone" 5 (%5) which is essentially the identifier that indicates which IP Network Interface Card (NIC) the address is tied to. While these data reflect the interface capability of the Oracle VirtualBox environment, the IP Address 192.168.100.10 is configured in the stored operating system and when launched here, automatically assumed the same IP address. IPv6 is addressed here for completeness.

The IPv4 address used (192.168.x.x) is a "Private Network" address per Internet Standard RFC-1918 and is NOT directly routable across the Internet. However, firewalls, routers and other network devices use a service called Network Address Translation (NAT) or Port Address Translation (PAT) to convert these private addresses to publicly routable addresses and allow them to be transmitted over the larger Internet. Thus, the use of a private network address assigned to a particular Ethernet interface does not in itself, prevent the computer from accessing the Internet – it becomes necessary to examine all routers, firewalls and other networking equipment to determine whether the computer is capable of *direct* connection to the Internet via a translation mechanism such as NAT or PAT.

For every IPv4 address, the number is split into two parts – the first part of the number is the Network Address and the second part of the number is the Device Address. This is defined by the number of bits assigned to the network address and follows the IP address and a slash "/." "192.168.100.0/24" indicates the first 24 bits of this binary number constitutes the Network Address and the remaining 8 bits constitute the Device Address. This set of Device Addresses is referred to as a Subnet. For data to leave a subnet, the subnet must have a Default Gateway assigned. When a computing device sends data to an address that is outside the Subnet group of addresses, it sends that data to the Default Gateway address which then *routes* the data onward to its destination.

There are two special Device Addresses: the first value in the Device Address is used to specify the Network Address while the last address in the subnet range is defined as a Broadcast Address and is used to send data to every device in the Subnet. In the address example "192.168.100.0/24," the first address is 0 and is the Network Address is 255; a broadcast to all 254 device addresses possible on this subnet would be sent to "192.168.100.255." The first usable address of this subnet is "192.168.100.1," which is typically used for the Default Gateway address.

The IPv6 address used (FE80:x:x:x:x:x:x) is a *link-local* address, which means that it is also not routable across the Internet. The concept of NAT and PAT are not used in IPv6, *with the single exception of using it to translate IPv6 addresses to IPv4 addresses and vice versa* because not all network equipment is capable of using IPv6 (yet). Some legacy network equipment widely in use today is not capable of transporting IPv6.

This link-local (FE80) address is not routable and is not supposed to be translatable from IPv6 to IPv4 and vice versa, however this depends on whether a particular network device vendor has followed the standard when implementing their software. While most vendors have designed their devices properly (network devices would not work properly otherwise), from a scientific and evidentiary perspective, it still remains necessary to forensically examine all connected network devices to ensure that these addresses cannot reach the Internet.

APPENDIX D. NATION-STATE CYBER ATTACK CAPABILITIES

Introduction

The mere idea of advanced Nation-State cyberwarfare capabilities at first blush seems like fantasy straight out of a James Bond film. Yet these attack capabilities are the most sophisticated on the planet. Most countries, including the USA, consider their defensive and offensive cyberwar capabilities to be highly classified. In the USA these are implemented by the National Security Agency, specifically in its Tailored Access Operations (TAO) group according to numerous reports, and in the UK, by the CGHQ. In this appendix, a short synopsis (and bibliography) of several of the more sophisticated cyberattacks are presented, *in particular in support of statements made elsewhere in this document* –specifically, that attacks occur *extremely quickly,* that <ins>a USB Thumb Drive can be infected with malicious software which can then infect other computer systems</ins>, and that cyberattacks can cause considerable damage. This is a very small sampling of some of the more sophisticated attacks but is illustrative of the advanced sophistication and the pervasive nature of vulnerabilities.

Security experts in the USA also understand and have documented issues with Voting Systems security, in *this report* https://archive.org/details/6432002-Voting-Village-Report-defcon27/page/n15/mode/2up. This security conference (Defcon 2019) is often billed as a "hacker" conference, however some of the most renowned security professionals in the world attend it, and the "Voting Village" at Defcon, in the referenced report, is co-chaired by Matt Blaze, Professor of Law and McDevitt Chair for the Department of Computer Science, Georgetown University (and author of many books on the subject). Christopher Krebs, Director of the US Critical Infrastructure Security Agency (CISA) also attended.

In 1984, while working at Bell Telephone Laboratories, I witnessed one of the very first destructive computer viruses. In that era, computer monitors used standard NTSC television signals to present video on a large cathode ray tube "tv screen". The monitor used a very high voltage (tens of thousands of volts) to cause the electron beam to display a picture. To generate the high voltage, the monitor used a "flyback" transformer, a specific type of high-frequency transformer commonly found in televisions, that took advantage of the 15,575 hertz horizontal scan signal that is part of the NTSC standard video signal. This signal was amplified and fed the primary winding of the transformer. It was found that the video driver circuit card in primitive 'PCs' of that era allowed the frequency of the horizontal scan signal to be programmed. When that frequency was programmed to 0 hertz, the electric current through the primary winding of the transformer changed from a rapidly varying signal to a constant "on" state. Since this state exceeded the capability of the transformer, it burned the transformer out, destroying the monitor.

In 2007, DHS and the Idaho National Laboratory ran the Aurora Generator Test to demonstrate vulnerabilities in the electric power grid in the USA.[81] A leaked video [82] of the attack is widely available on the Internet and shows the complete destruction of a 27 ton, 2.25MW generator by a cyberattack. In this attack, the attackers (part of the US Military) opened the relays of the generator (by remote computer control) long enough for the generator to slip out of synchronization with the power grid, and then reconnected the relays, causing a catastrophic mechanical jolt to the generator. This is the equivalent of driving your car at 70 mph, and while moving at that speed, placing your car into reverse gear. They did this three times, as is apparent from the video. The third time was "the charm" as the generator's diesel

---

[81] https://en.wikipedia.org/wiki/Aurora_Generator_Test
[82] https://youtu.be/LM8kLaJ2NDU

engine self-destructs and the room as well as the external exhaust pipe fill with black smoke. The article cited[83] includes both the video of the test showing destruction of the generator as well as the original DHS report, released under FOIA.

Adversaries constantly scan and probe every computer on the internet to identify weakness well in advance of the need for an attack. A commercial (i.e., unclassified) example of this scanning is demonstrated by the company Lumeta. During the first Gulf War, noted security expert Bill Cheswick, co-founder of Lumeta, used a common troubleshooting tool (ping) and was able to perform real-time battle-damage assessment by detecting computers that went offline due to active bombing campaigns. Adversaries have discovered their targets well in advance and have pre-programmed attacks ready to launch.

Moonlight Maze

"Moonlight Maze was a 1999 US government investigation into a massive data breach of classified information. It started in 1996 and affected NASA, the Pentagon, military contractors, civilian academics, the DOE, and numerous other American government agencies. By the end of 1999, the Moonlight Maze task force was composed of forty specialists from law enforcement, military, and government. The investigators claimed that if all the information stolen was printed out and stacked, it would be three times the height of the Washington Monument, which is 555 ft (169 m) tall. The Russian government was blamed for the attacks, although there was initially little hard evidence to back up the US accusations besides a Russian IP address that was traced to the hack. Moonlight Maze represents one of the first widely known cyber espionage campaigns in world history. It was even classified as an Advanced Persistent Threat (a very serious designation for stealthy computer network threat actors, typically a nation state or state-sponsored group) after two years of constant assault. Although Moonlight Maze was regarded as an isolated attack for many years, unrelated investigations revealed that the threat actor involved in the attack continued to be active and employ similar methods until as recently as 2016."[84]

Stuxnet

Stuxnet was an offensive operation, believed to be conducted by the USA and Israel,[85] to destroy nuclear enrichment centrifuges at Iran's Natanz enrichment facility,[86] About 1,000 centrifuges were involved in the enrichment of 'yellow cake' uranium from "fuel grade" for commercial power reactors to "weapons grade" to create nuclear weapons (bombs/missiles).

"Stuxnet was a 500-kilobyte computer worm that infected the software of at least 14 industrial sites in Iran. This worm was an unprecedentedly masterful and malicious piece of code that attacked in three phases. First, it targeted Microsoft Windows machines and networks, repeatedly replicating itself. Then it sought out Siemens Step7 software, which is also Windows-based and used to program industrial control systems that operate equipment, such as centrifuges. Finally, it compromised the programmable logic controllers. The worm's authors could thus spy on the industrial systems and even cause the fast-spinning centrifuges to tear themselves apart, unbeknownst to the human operators at the plant."

[84] https://en.wikipedia.org/wiki/Moonlight_Maze

[85] https://www.jpost.com/International/Snowden-US-Israel-created-virus-to-destroy-Iran-nukes-319226

[86] https://www.wired.com/2010/11/stuxnet-sabotage-centrifuges/

"Stuxnet could spread stealthily between computers running Windows—even those not connected to the Internet. If a worker stuck a USB thumb drive into an infected machine, Stuxnet could "worm" its way onto it, then spread onto the next machine that read that USB drive. Because someone could unsuspectingly infect a machine this way, letting the worm proliferate over local area networks, experts feared that the malware had perhaps gone wild across the world."

"In October 2012, U.S. defense secretary Leon Panetta warned that the United States was vulnerable to a "cyber–Pearl Harbor" that could derail trains, poison water supplies, and cripple power grids. The next month, Chevron confirmed the speculation by becoming the first U.S. corporation to admit that Stuxnet had spread across its machines." [87]

Operation Titan-Rain

Titan Rain was a series of coordinated computer attacks[88] on the United States that began in 2003 and originated from Guangdong, China. The attacks are believed to have come from the People's Liberation Army unit 61398, located at the Lingshui Signals Intelligence Unit on Hainan Island, one of China's largest military facilities in the South China Sea. This is the same unit responsible for the attack on the Wall Street Journal, which cyber forensics company Mandiant identified as APT-1 (Advanced Persistent Threat–1)[89].

"An **advanced persistent threat** (**APT**) is a stealthy threat actor, typically a nation state or state-sponsored group, which gains unauthorized access to a computer network and remains undetected for an extended period. In recent times, the term may also refer to non-state-sponsored groups conducting large-scale targeted intrusions for specific goals."[90]

Titan Rain is rumored to have stolen as much as 40 Terabytes of US Government secrets. This attack persisted for many years.

Operation Aurora

Operation Aurora was conducted by the People's Liberation Army of China from mid-2009 through December, 2009.[91]

It was a very large scale attack that affected numerous commercial entities including Google, Morgan-Stanley, Adobe Systems, Akamai Technologies, Juniper Networks, and Rackspace who have publicly confirmed that they were targeted. According to reports, Yahoo, Symantec, Northrop Grumman, Morgan Stanley, and Dow Chemical were also among the targets. The unit which conducted the attack has been named APT-17.

"The attack was named 'Operation Aurora' by Dmitri Alperovitch, Vice President of Threat Research at cybersecurity company McAfee. Research by McAfee Labs discovered that 'Aurora' was part of the file path on the attacker's machine that was included in two of the malware binaries McAfee said were associated

[90] https://en.wikipedia.org/wiki/Advanced_persistent_threat
[91] https://en.wikipedia.org/wiki/Operation_Aurora

with the attack. "We believe the name was the internal name the attacker(s) gave to this operation," McAfee Chief Technology Officer George Kurtz said in a blog post."

"According to McAfee, the primary goal of the attack was to gain access to and potentially modify source code repositories at these high-tech, security, and defense contractor companies. '[The software configuration management systems] were wide open,' says Alperovitch. 'No one ever thought about securing them, yet these were the crown jewels of most of these companies in many ways—much more valuable than any financial or personally identifiable data that they may have and spend so much time and effort protecting.' "

2020 US Government Attack

In 2020, a massive nation-state attack against many companies and US Government organizations took place.[92] Initially only the Treasury department and the NTIA were thought to have been attacked. But it turned out that many of the US Government operations including the IRS and even the US Administrative Office of the Courts (which relies heavily on the software SolarWinds) were compromised.

This attack was a supply-chain attack. SolarWinds, a network management system, as many software firms do, periodically releases updates to its software. SolarWinds was broken into and one of its update programs was infected with malware. Because SolarWinds was inappropriately assigned too much trust by its customers, their software updates were white-listed (allowed through the firewall, unchallenged). The attack was in the update.

This is widely regarded as one of the worst attacks in US history for the length of time it lasted (9 months) before detection as well as the impact it had upon affected organizations.

Summary

Nation-States including Russia, China, North Korea, Malaysia, Iran and many others seek to attack the USA's national security, economic, industrial, communications, and financial systems. These attackers are extremely sophisticated and well trained. For example, North Korea has an institute in Pyongyang that teaches cyberwarfare and has been turning out more than 100 graduates every month for well over 15 years. Other Nation-States, including Iran, have sent students to North Korea's school.

This brief history has documented the sophistication of advanced cybersecurity attacks.

Multiple references show that sophisticated attacks can occur by transfer through USB drives, without being detected by the end user.

This history shows how unprotected system configurations have enabled advanced cyberattacks, and how software updates can infiltrate a company's IT operations and take control.

APPENDIX E. SECURITY CONSIDERATIONS FOR SQL SERVER INSTALLATIONS

The following information was taken directly from Microsoft documentation and is provided here to be a reference to basic security considerations related to installations of Microsoft SQL Server. This is relevant as Microsoft SQL Server is the product used in the Dominion EMS.

From Microsoft SQL Server Documentation:

Security is important for every product and every business. By following simple best practices, many security vulnerabilities can be avoided. Below are some security best practices that should be considered both before installing SQL Server and after SQL Server has been installed. Security guidance for specific features is included in Microsoft reference articles for those features.

Before Installing SQL Server:
- Follow these best practices when setting up the server environment:
- Enhance physical security
- Use firewalls
- Isolate services
- Configure a secure file system
- Disable NetBIOS and server message block

Details about these items are provided below.

Enhance Physical Security

Physical and logical isolation make up the foundation of SQL Server security. To enhance the physical security of the SQL Server installation, do the following tasks:
- Place the server in a room accessible only to authorized persons.
- Place computers that host a database in a physically protected location, ideally a locked computer room with monitored flood detection and fire detection or suppression systems.
- Install databases in the secure zone of the corporate intranet and do not connect your SQL Servers directly to the Internet.
- Back up all data regularly and secure the backups in an off-site location.

Use Firewalls

Firewalls are important to help secure the SQL Server installation. Firewalls will be most effective by following these guidelines:
- Put a firewall between the server and the Internet. Enable your firewall. If your firewall is turned off, turn it on. If your firewall is turned on, do not turn it off.
- Divide the network into security zones separated by firewalls. Block all traffic, and then selectively admit only what is required.
- In a multi-tier environment, use multiple firewalls to create screened subnets.
- When you are installing the server inside a Windows domain, configure interior firewalls to allow Windows Authentication.

Isolate Services

Isolating services reduces the risk that one compromised service could be used to compromise others. To isolate services, consider the following guidelines:
- Run separate SQL Server services under separate Windows accounts. Whenever possible, use separate, low-rights Windows or Local user accounts for each SQL Server service.

Configure a Secure File System

Using the correct file system increases security. For SQL Server installations, you should do the following tasks:

- Use the NTFS file system (NTFS). NTFS is the preferred file system for installations of SQL Server because it is more stable and recoverable than FAT file systems. NTFS also enables security options like file and directory access control lists (ACLs) and Encrypting File System (EFS) file encryption. During installation, SQL Server will set appropriate ACLs on registry keys and files if it detects NTFS. These permissions should not be changed. Future releases of SQL Server might not support installation on computers with FAT file systems.
- Use a redundant array of independent disks (RAID) for critical data files.

Disable NetBIOS and Server Message Block

Servers in the perimeter network should have all unnecessary protocols disabled, including NetBIOS and server message block (SMB).

NetBIOS uses the following ports:

- UDP/137 (NetBIOS name service)
- UDP/138 (NetBIOS datagram service)
- TCP/139 (NetBIOS session service)

SMB uses the following ports:

- TCP/139
- TCP/445

During or After Installation of SQL Server

After installation, you can enhance the security of the SQL Server installation by following these best practices regarding accounts and authentication modes:

Service accounts

- Run SQL Server services by using the lowest possible permissions.
- Associate SQL Server services with low privileged Windows local user accounts, or domain user accounts.

Authentication mode

- Require Windows Authentication for connections to SQL Server.
- Use Kerberos authentication.

Strong passwords

- Always assign a strong password to the sa [system administrator] account.
- Always enable password policy checking for password strength and expiration.
- Always use strong passwords for all SQL Server logins.

APPENDIX F. C.R.S. 1-5-608.5

1-5-608.5. Electronic and electromechanical voting systems - testing by federally accredited labs - certification and approval of purchasing of electronic and electromechanical voting systems by secretary of state - conditions of use by secretary of state - testing.

(1) A federally accredited laboratory may test, approve, and qualify electronic and electromechanical voting systems for sale and use in the state of Colorado.

(2) (Deleted by amendment, L. 2009, (HB 09-1335), ch. 260, p. 1190, § 4, effective May 15, 2009.)

(3)

(a) If the electronic and electromechanical voting systems tested pursuant to this section satisfy the requirements of this part 6, the secretary of state shall certify such systems and approve the purchase, installation, and use of such systems by political subdivisions and establish standards for certification.

(b) The secretary of state may promulgate conditions of use in connection with the use by political subdivisions of electronic and electromechanical voting systems as may be appropriate to mitigate deficiencies identified in the certification process.

(c) In undertaking the certification required by this section, the secretary of state may consider either procedures used or adopted by county clerk and recorders or best practices recommended by equipment vendors.

(3.5)

(a) [Editor's note: Subsection (3.5) is effective July 1, 2022.]   On and after December 31, 2022, if an electronic and electromechanical voting system tested pursuant to this section satisfies the requirements of this part 6 related to the use of the system in an election using instant runoff voting and the rules established by the secretary of state pursuant to section 1-5-616 (1.5), the secretary of state shall certify such system and approve the purchase, installation, and use of such system by political subdivisions in an election using instant runoff voting.

(b) The secretary of state may promulgate conditions of use in connection with the use by political subdivisions of an electronic and electromechanical voting system in an election using instant runoff voting as may be appropriate to mitigate deficiencies identified in the certification process.

(c) In undertaking the certification required by this section, the secretary of state may consider procedures used or adopted by county clerk and recorders or best practices recommended by equipment vendors.

(4) In undertaking the certification required by this section, the secretary of state may request a federally accredited laboratory to undertake the testing of an electronic or electromechanical voting system or may use and rely upon the testing of an electronic or electromechanical voting system already performed by another state or a federally accredited laboratory upon satisfaction of the following conditions:

(a) The secretary of state has complete access to any documentation, data, reports, or similar information on which the other state or laboratory relied in performing its testing and will make such information available to the public subject to any redaction required by law; and

(b) The secretary of state makes written findings and certifies that he or she reviewed the information specified in paragraph (a) of this subsection (4) and determines that the testing:

(I) Was conducted in accordance with appropriate engineering standards in use as of the time the testing is undertaken; and

(II) Satisfies the requirements of sections 1-5-615 and 1-5-616 and all rules promulgated thereunder.

(5) In undertaking the certification required by this section, the secretary of state may conduct joint testing with an agency of another state or with a federally accredited laboratory.

APPENDIX G. C.R.S. 1-5-615

1-5-615. Electronic and electromechanical voting systems - requirements.

(1) The secretary of state shall not certify any electronic or electromechanical voting system unless such system:

(a) Provides for voting in secrecy;

(b) Permits each elector to vote for all offices for which the elector is lawfully entitled to vote and no others, to vote for as many candidates for an office as the elector is entitled to vote for, and to vote for or against any ballot question or ballot issue on which the elector is entitled to vote;

(c) Permits each elector to verify his or her votes privately and independently before the ballot is cast;

(d) Permits each elector privately and independently to change the ballot or correct any error before the ballot is cast, including by voting a replacement ballot if the elector is otherwise unable to change the ballot or correct an error;

(e) If the elector overvotes:

(I) Notifies the elector before the ballot is cast that the elector has overvoted;

(II) Notifies the elector before the vote is cast that an overvote for any office, ballot question, or ballot issue will not be counted; and

(III) Gives the elector the opportunity to correct the ballot before the ballot is cast;

(f) Does not record a vote for any office, ballot question, or ballot issue that is overvoted on a ballot cast by an elector;

(g) For electronic and electromechanical voting systems using ballot cards, accepts an overvoted or undervoted ballot if the elector chooses to cast the ballot, but it does not record a vote for any office, ballot question, or ballot issue that has been overvoted;

(h) In a primary election, permits each elector to vote only for a candidate seeking nomination by the political party with which the elector is affiliated;

(i) In a presidential election, permits each elector to vote by a single operation for all presidential electors of a pair of candidates for president and vice president;

(j) Does not use a device for the piercing of ballots by the elector;

(k) Provides a method for write-in voting;

(l) Counts votes correctly;

(m) Can tabulate the total number of votes for each candidate for each office and the total number of votes for and against each ballot question and ballot issue for the polling location;

(n) Can tabulate votes from ballots of different political parties at the same voter service and polling center in a primary election;

(o) Can automatically produce vote totals for the polling location in printed form; and

(p) Saves and produces the records necessary to audit the operation of the electronic or electromechanical voting system, including a permanent paper record with a manual audit capacity.

(1.5) [Editor's note: Subsection (1.5) is effective July 1, 2022.] The secretary of state shall not certify any electronic or electromechanical voting system for use in an election using instant runoff voting unless, in addition to meeting the requirements of subsection (1) of this section, the system meets the requirements and performs the functions required by section 1-7-1003.

(2) The permanent paper record produced by the electronic or electromechanical voting system shall be available as an official record for any recount conducted for any election in which the system was used.

APPENDIX H. MAN IN THE MIDDLE ATTACK

In Figure 10, an encryption certificate is not visible. This is due to the fact that an encryption certificate had not been created and assigned. This alone does not indicate the lack of a security encryption certificate, because SQL Server will create a self-signed certificate automatically, as it has done in this case. However, self-signed certificates are known to be insecure and susceptible to common man-in-the-middle attacks. On a voting system, where security should be paramount, this is wholly irresponsible at best.

Despite the direct connection to the back-end of the SQL server is set to be encrypted even in this sub-par fashion, any device with Microsoft SQL Server Management Studio or any other SQL Server client installed that supports the Windows Authentication method can connect to the server provided they have some type of connection (directly or indirectly) to any part of the voting system network, can find the server IP address, a userID and a password. Microsoft SQL Server Management Studio is a free download from Microsoft and does not require any special licensing – anyone can obtain it and use it without restriction. There are also many other SQL Clients that exist for Windows, OS X, iPhone, Android, and others, many that are free to download and use.

The SQL Server Management Studio (SSMS) software used on the Expert's client computer was downloaded directly from Microsoft, and that Expert's client computer had no prior encryption configuration, encryption keys or certificates containing encryption keys – the only things supplied to make the connection to the EMS server were a userID, password, and the IP address of the server.

Detail:

A "Man-In-The-Middle" attack (MITM) is an attack where an eavesdropper intercepts a communication between two parties, and makes each party believe he (or she) is the person they intended to communicate with by impersonating them.

In Figure 67 below, Person A would normally communicate with Person B directly. The attack involves intercepting the communication and impersonating the other party as illustrated by the red arrows and Person C.
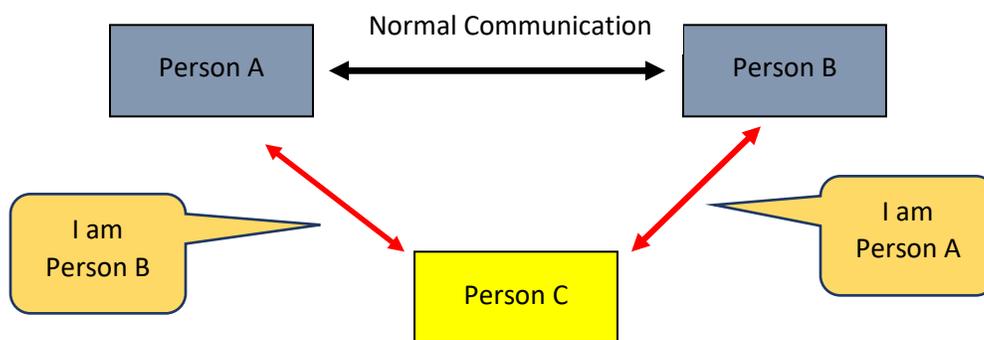

Figure 67 - Man In The Middle Attack

In the MITM attack, Person C can eavesdrop undetected, and can also alter or insert data that the other parties are unaware of. This is often used to steal passwords as well as change information, when the communication is unencrypted.

When the communication is encrypted with an encryption certificate, the certificate must be checked to be sure it is authentic and valid. If these checks are not properly performed, the MITM attack becomes possible.

A public Certificate Authority (a commercial service that can be purchased) usually guides the user through the proper certificate checking process when setting up the service. Alternatively, encryption may be setup using a Self-Signed Certificate, however the user is dependent upon their own knowledge and experience, thus Self-Signed Certificates are more prone to human error, oversight, or lack of knowledge of the proper process. If the checks are not properly setup, either method may be subject to this attack method.

While this seems complicated to setup for the average user, devices that perform MITM attacks are commonly available (see the Wi-Fi Pineapple, https://shop.hak5.org/products/Wi-Fi-pineapple). Tools such as these are used by cybersecurity professionals to check for the kind of misconfiguration that would allow an MITM attack, with the goal of helping the client fix those security problems, once identified. However, the devices are available for purchase by anyone.

APPENDIX J. FORENSIC IMAGING TECHNOLOGY

In the forensic community, forensic imaging is often referred to as producing a bit-for-bit image of a data storage medium, most of which historically have been hard disk drives. The statement is not quite so simple – as this Appendix explains.

In the figure below, internal components of a hard disk drive are illustrated. The blue disks are the actual 'disk platters', each of which have an upper magnetic media surface and a lower magnetic media surface. Each disk platter is mounted on a center shaft, called a 'spindle' which is connected to a motor that rotates the disks. For each media surface (i.e., where data can be stored) there is an armature (illustrated in black on the right) with a read/write head (in red, at the end of the armature). In this illustration, there are 4 platters with 2 media surfaces each, for a total of 8 surfaces where data can be stored.

As the disk spins, the read/write heads (similar to the heads in a magnetic tape recorder) move over the data and can read and write new data by magnetizing the disk media. These heads actually aerodynamically fly, a micron or so above the disk platter.
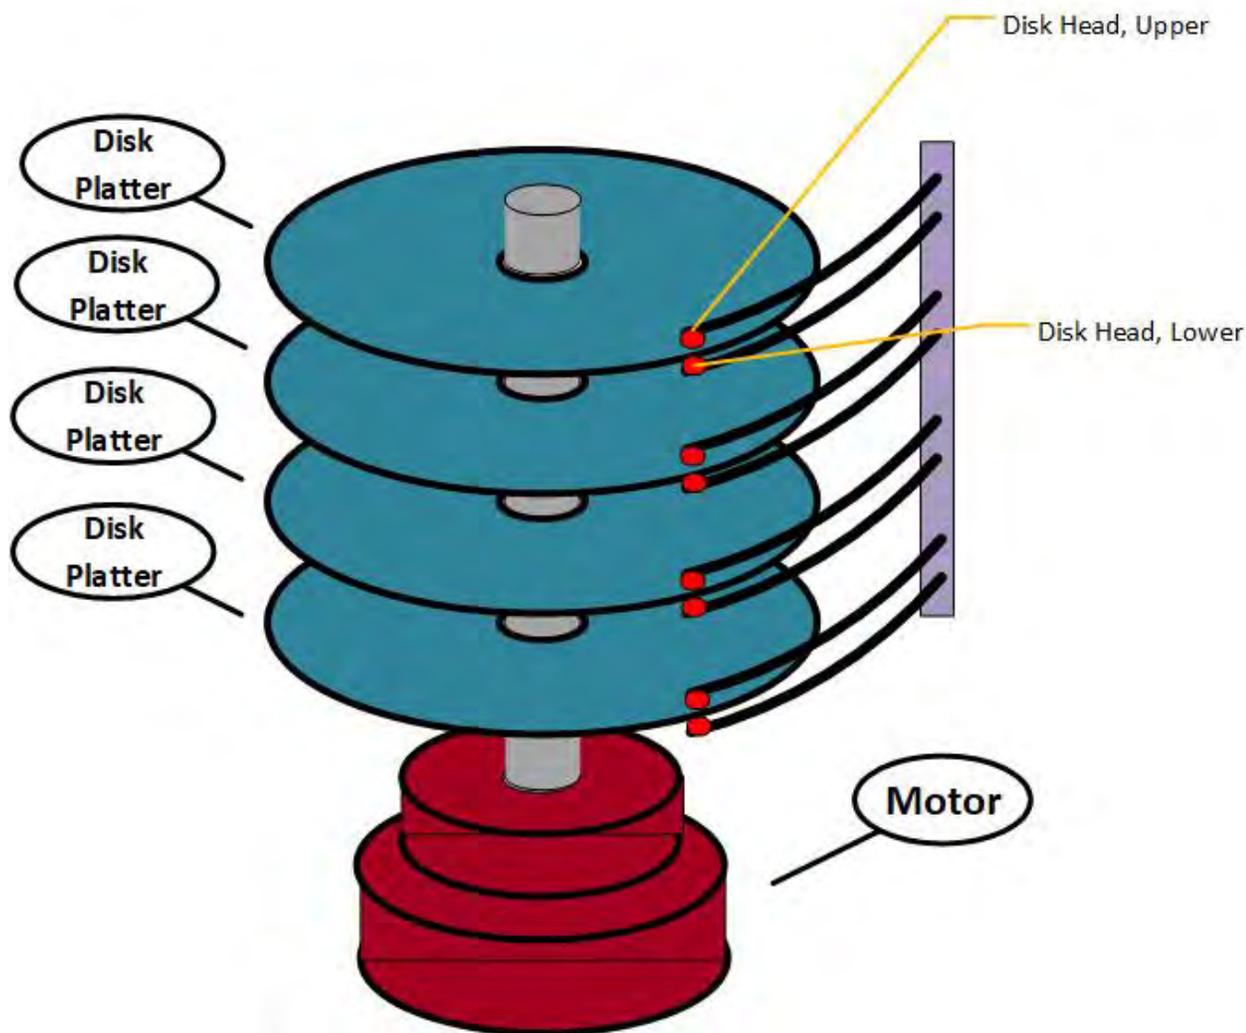

Figure 68 - Illustrative Hard Disk Components

Much like a pizza, each platter surface is divided into sectors (nearly triangular, just as pizza slices are). The surface is further divided into tracks – concentric rings that are smaller and smaller as they move toward the center of the disk. This organization is illustrated in a highly simplified illustration in Figure 67.
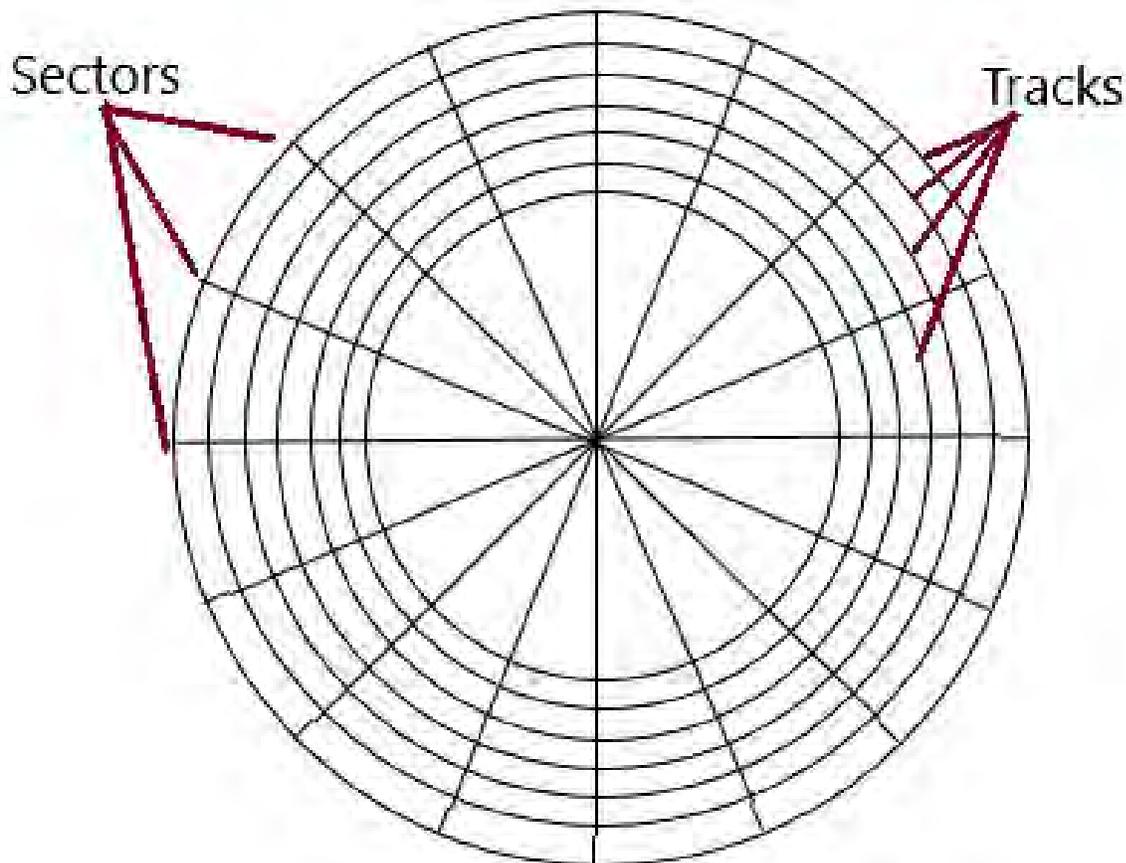

Figure 69 - Disk Track and Sector illustration

In the 1970's, magnetic media was manufactured to have a defect-free surface, but this was prohibitively expensive. Winchester disk technology provided a solution to the high expense. Rather than manufacture a disk media surface that was 100% usable, the manufacture of disk media with a 98% usable surface provided the ability to reduce cost very significantly. This allowed for defective areas on the disk – sectors in which data could not be reliably stored. But this required a scheme to identify these bad areas and ignore them. A map of the disk was developed, from the first sector to the last. As the disk was manufactured, the surface was tested for defects and those sectors with defects were added to the Permanent Defect list, today referred to as the p-list. When the disk is formatted, the disk controller (contained in the disk itself, on its circuit card) will access each physical sector on the disk that is <u>not</u> contained in the p-list, and label that sector with a sequential sector number known as a Logical Block Address (LBA). Obviously the LBA will skip over those sectors in the Defect list. To accommodate the growth of future defects, a list of new bad sectors (to be discovered later in the life of the device) would be added to a Growth List, known as a G-list.

Disk drives are manufactured with more capacity than the end user can access. For example, a 500Gb disk may actually have 580Gb of media storage available. This extra area is known as the Service Area of the disk, and is inaccessible except to the physical disk controller (circuit card that is part of the disk drive itself).

The p-list may be stored in a read-only memory (ROM) on the physical disk controller, or it may be stored in the service area. The g-list is empty at manufacture time and cannot be stored in a ROM but is rather stored in the service area of the disk. The remainder of the service area consists of spare sectors – unused sectors. When a new bad sector is discovered (i.e., a new disk failure) special disk access commands in the disk driver software instruct the disk that a specific logical block is bad and that block is added to the g-list, together with the identity of a spare sector used to replace that sector. The physical disk controller may have replaced physical sector 3921 (LBA 3921) with spare sector 616416, but the new physical storage sector is still addressed by the host computer controller as LBA 3921 because of this mapping. This permits the disk to continue to be used without the computer (and consequently its software) being aware of the replacement sector. If data was unreadable from the damaged sector, the data (file) stored in that location may be damaged and have to be replaced but the disk device still appears, to the computer, to work normally.

Because the sectors in the p-list were defective and never used after manufacture at all, and the g-list sectors were determined after manufacture to be defective, they cannot be read at all. The physical disk controller (built into the drive) has made these p-list and g-list sectors no longer accessible. Spare sectors are also not accessible in the service area of the disk as they are intended to be used as future replacements for active data storage. Finally some physical disk controllers store disk firmware in the service area of the disk but this is neither accessible nor usable to the end user or to the host computer system, buy ONLY to the physical disk controller itself.

Thus, there exist data storage areas on a hard drive that have a list of bad sectors, the actual bad sectors themselves that cannot be read, and spare sectors used to repair the drive (and sometimes disk controller firmware). These data storage areas are protected from access to ensure that the drive can be used even though some defects are present from manufacture and others may develop during the lifetime of the drive.

This detail is provided to explain from a scientific perspective that the statement that "every physical bit on a hard drive is accessible and preserved in a forensic image" is true because the logical hard drive, i.e., the total user accessible data area, is what the computer itself and the user are able to access and every bit of data is preserved exactly as it existed at the time of imaging the data. These data in the service area of the data storage system are not accessible to the computer or any user, are not able to be read by forensic software, and they are not copied as part of a forensic image, but they are also not relevant to a forensic analysis of the computer system as none of the data in this service area can be read, written or manipulated without special equipment used by the manufacturer to create the storage device.

The unreadable service area on the drive is not accessible by the computer and does not contain any user accessible data. Even when a bad sector is added to the g-list, the computer does not access the protected service area; it sends a command to the physical disk controller which adds the sector to the g-list and remaps a spare sector in its place.

The remainder of the disk is known as 'user accessible data area' and is accessible by the computer system. This user accessible data area is formatted by the computer operating system, Microsoft Windows Server 2016 standard in the case of the Mesa County EMS server, and the data components necessary to create a file system are added to the drive (Master Boot Record, Partition Table, list of free data blocks / sectors, directories and ultimately files containing program and user data). Data in the user accessible data area can be created, modified, or overwritten. When a file is "deleted" by the operating system, the directory

entry is marked indicating that the directory slot is now available to be reused and the sector numbers previously occupied by the file are added back to the list of free data blocks (the free list). The data is not physically deleted from the drive – the drive area is simply marked as available for reuse. When the sectors previously occupied (by for example, data from a photographic image, 1 megabyte in size) are reused by a smaller file, for example, 10,000 bytes of data, the remainder of the original file is still present on the drive and these 990,000 bytes of the photo image in this example can be recovered. Forensic practitioners call this "carving" data from the unallocated disk data, because the boundaries of the previous data are no longer defined and must be discovered by the practitioner to successfully recover the data. These data are fragments of previous files, and while recoverable, are incomplete and sometimes present the forensic analyst with difficulty even determining what kind of data it previously was. Data that has been partially overwritten is not likely recoverable, but the remainder of the data that was not overwritten is able to be recovered. Absent context it may not be possible to draw a conclusion from the data so recovered, however sometimes enough information persists that it supports a conclusion alone or in combination with other data recovered.

All data, and every bit stored in the <u>user accessible data area</u> on the disk drive are captured by a forensic image of the entire disk system and are accessible to the forensic analyst in the forensic image. Thus, for all practical purposes, every possible bit and byte of data on the storage device that is accessible is captured and its integrity preserved such that any modification or alteration of the forensic image is detectable.

The data storage device may be a spinning magnetic disk storage device (hard drive), or it may include Solid State Disks (SSD) or other storage devices and may be in a Redundant Array of Independent Disk (RAID) configuration, in which case the data captured in a forensic image will include every bit of data in the <u>logical</u> hard drive exactly as presented to the computer by the data mass storage subsystem. From an evidentiary point of view, the forensic image captures and preserves every bit and byte of data in the logical view of the physical disk. The forensic imaging software copies all the data that can be accessed by the computer system regardless of whether it is partitioned and formatted or not.

Data that has been completely overwritten is not likely recoverable. "Completely overwritten" means that a sector containing 512 bytes of data is overwritten with 512 bytes of new data (random data in the case of "drive wiping" software). The US Department of Defense considers a file containing classified information (up to the Secret classification) to be adequately destroyed and unrecoverable when overwritten with random data 7 times.

In this examination, the term "hard drive image" refers to this exact data set presented to and operated upon by the computer system. It is a complete set of all data accessible to the computer or computer operator and is an accurate reproduction of ALL of the data on the disk system that can be accessed by the computer under examination.

The original data in the integrity-protected forensic archive cannot be altered, and preserves forensic chain of custody, because this examination used an exact copy of from the original preserved in the forensic archive.

In this Appendix the capability of a forensic image has been explained, with the technical detail of hard drive technology to aid in the understanding that the statement that "every bit and byte of data in the hard drive is captured and preserved", made with reference to the logical view of the data storage medium is technically accurate, and that "every bit and byte of data that can be accessed by a human or a computer

operating system IS captured and preserved", integrity controlled and evidentiarily a complete set of all possible data is preserved and presented in the examination.

APPENDIX K. ACCESSING A COMPUTER WITHOUT A PASSWORD

It is a common belief that a password provides safety as a security mechanism.

In this Appendix I discuss some of the many methods by which password can be bypassed, at a high level. Step-by-step instruction is not provided here. Many books have been published[93] and many professional instruction courses and certifications[94] exist for those in the field who need or desire it and it is not my purpose to repeat that content here.

Finding a password

Many resources exist on the Darkweb[95] to obtain passwords that have been broken by criminals and are either offered for free or for sale. The article cited discusses 1.4 billion passwords available for free on the Darkweb. US Title 18, section 1029 makes trafficking in passwords or access devices a crime. I did not search the Darkweb for these passwords because trafficking in passwords is a crime, the Darkweb is also full of criminal content, some of which the mere possession of without any intent, is a crime, as well as malware and ransomware, often disguised in innocent-looking webpages. Venturing onto the Darkweb is a good way to lose all your computer data as a consequence of encountering these subversive "traps".

Method #1 is simply looking up the password. Despite the risk of computer infection or damage, many people do use the Darkweb and this content is available in many cases for free. This risk is so prolific that many services monitor this for you, Norton LifeLock and Identity Force among them, by searching for your credentials on the Darkweb and providing notification if your access has been compromised.

Cracking a password

Passwords, when entered, are encrypted and only the encrypted form of the password is stored. When a person enters a password to login, it is again encrypted and the result is compared to the stored encrypted password. The two encrypted passwords are compared and if they match, access is granted. The encrypted, stored password is *never* decrypted in the process of granting access.

It is possible, once the encrypted stored passwords are obtained, to run various "password cracking" software that tries all conceivable combinations of letters, numbers and symbols until a match between the encrypted stored password and the result under test. The password "cracker" outputs the unencrypted password, once found.

Rainbow Tables

Encrypting every possible password (called a "brute force" method) requires an extensive amount of computing power and is remarkably slow. To speed this process up, "rainbow tables" have been created.

[95]   https://www.csoonline.com/article/3266607/1-4b-stolen-passwords-are-free-for-the-taking-what-we-know-now.html

These are tables of encrypted passwords and the corresponding plaintext password allowing the application to simply search the list for a matching entry rather than encrypting every possible combination until a match is found.

Many sources of rainbow tables and the software that uses them exist on the Internet and are readily available.

Bypassing a password

It is possible to bypass a password requirement altogether by using special software on a CD, USB thumb drive or other media or installed by one of many access methods. Security professionals use capabilities like password bypass when a password is forgotten and must be recovered. Microsoft operating systems even include the option to create such a bypass mechanism when the operating system is installed (a password recovery disk). There are many password recovery methods identified on the Internet that perform this function across many different operating systems and are readily available on demand including, specifically, for Microsoft Windows Server 2016 Standard.[96]

Exploitation of Services

Often, in the programming of a computer service, for example, a web server, mistakes and oversights are made in the programming process that leave opportunities for a malicious person to obtain unauthorized access. One such example is the inclusion of "non-printable" characters in an input value (meaning that the included data does not show on a screen). This technique fools the receiving computer into accepting part of the input value as a command that it should execute (a command that means "send me your password file," for example). There are many different ways to do this, each with their own deep technical explanation (buffer overflow, cross-site scripting, code injection, manipulation of software timing, etc.). There are many penetration testing textbooks that explain the deep technical process and teach how to do this.

These types of mistakes and oversights account for nearly 170,000 identified weaknesses that allow a computer to be attacked. The CVE[97] system operated by Mitre Corp. has identified 169,169 publicly disclosed vulnerabilities to date. The National Vulnerability Database (NVD[98]) is provided by the National Institute of Technology and Standards (NIST) and contains 808 vulnerabilities that provide full administrative access (between 2005 and the time of this writing). Computer vulnerabilities (weaknesses) are identified nearly daily, and are reported and validated before being published in the CVE or NVD repositories. There exist more vulnerabilities than are publicly known; many are under investigation, not yet validated, while others are known to the US military and intelligence communities and are classified. From these 808 publicly known vulnerabilities, many could be applied to the Mesa County EMS server to grant the type of access demonstrated in this report.

There are entire suites of software that simplify and automate the capability. Manually performing an exploitation may be a difficult process that requires deep technical knowledge but these automated suites simplify the task making it accessible to a larger population of people. For example, Metasploit can obtain access to a system and return to the user a fully logged-in session with administrative access, allowing the

malicious user to do whatever they want to with the system, including stealing or altering data. Kali Linux is an operating system (intended for security professionals to test the security of systems) that contains Metasploit and many dozens of other security tools that can be used to exploit a computer system.

Even passwords (and encryption keys) specific to Dominion Voting Systems have been revealed on the Internet, by no less than the U.S. Election Assistance Commission, and are available online at the time of this writing. One such report with the actual system passwords and encryption keys was published more than 10 years ago and is still available online.

Intel Active Management Technology (AMT) and Management Engine (ME)

Every processor made by Intel since 2008, as well as processors made by AMD and others, incorporate a form of this Management Engine (ME) technology.[99] This has not been popularized broadly but is a serious concern for all computer systems.

Embedded in the silicon of microprocessors is an independent processor with its own operating system. This processor runs even when the power is off (as long as there is power to the motherboard), and is accessible via the computer's network interface. It provides its own IP address and MAC address and is capable of bypassing the operating system.

Vulnerabilities identified in 2017 were identified as critical.[100] Researchers indicated that it was possible to read passwords from memory (among other things) and completely bypass the Operating System of today's computers. While no exploitation of this capability has been identified that we know of, Nation-States (including our own) would consider the ability to be highly classified – to the point – we would not know about it.

The vulnerabilities are known as Meltdown and Spectre. They are side-channel attacks against systems.[101]

These vulnerabilities if exploited could provide complete access, undetectably, to a system, even with the computer in a "shutdown" state, as long as the system is plugged in (i.e., power is supplied to the motherboard). This continuous power to the motherboard has long been a feature in modern computer systems and is how the "Wake on LAN" feature is able to function … it is not that the computer has no power, it just has very low power applied.

Dell Integrated Remote Access Controller (iDRAC)

Dell offers a capability known as iDRAC on its servers.[102] It is a completely separate processor with its own Ethernet interface, IP and MAC addresses. It is intended to be used on a highly restricted network for "out of band" management of the server, and allows an administrator (or anyone with access[103]) to reboot the system, access and change the BIOS, and alter the system without the motherboard's processor being able

[103] Note that this document identifies the default iDRAC userID and password as "root" and "calvin".

to detect this activity. If you have a server in a data center 30 miles (or more) from your office that needs to be rebooted, and you don't have staff at this remote location, driving an hour or more just to reboot the system is an impediment to productivity – the iDRAC is intended to provide remote control for just this reason.

The primary computer has no way to detect the use of the iDRAC; if used the primary computer's audit and system logs would not record it. An iDRAC is intended to permit access to the core computer and its files.

Strengthening Access Security

One technique for strengthening access security is multi-factor authentication. This is an industry-standard practice and recommended by the National Institute of Standards and Technology (NIST) among many other technical and professional organizations.

Many readers will recognize this multi-factor authentication as something you have already used, once you understand what it is. Multi-factor authentication requires identification be verified by techniques in two or more of the three categories:

1. Something you know (a password, special code, birthday, or other identifying number not related to the information you are accessing),
2. Something you have (an access token, a calculator that accepts an input number and returns an encrypted response, a cellphone where you receive a message to authorize the access, etc.), and
3. Something you are (biometric information, a fingerprint, retina scan, iris scan, face recognition, etc.).

Systems that send you a verification code via cell phone SMS message are a good example of the use of multi-factor authentication.

Best practice in access security is to apply the principle of "Defense in Depth," which is to apply multiple layers of security such that if one fails another serves to protect the system. A "hardened" system requires Defense in Depth, and the proper implementation of multiple security mechanisms, as specified in the DoD Security Technology Implementation Guides (STIGs).

The US Department of Defense employs thousands of military and contractor staff who work full-time on the problem of maintaining sufficient cybersecurity to (hopefully) stay ahead of the threat. Homeland Security maintains a significant cybersecurity division, as does the National Security Agency (NSA) and other parts of the US intelligence community; the Critical Infrastructure Security Agency (CISA) is dedicated to this mission; NIST maintains an entire division for cybersecurity; the DOJ maintains its own capability for the investigation and prosecution of these High-Tech crimes and the High-Tech Criminal Investigator's Association (HTCIA) provides a public private partnership with their law enforcement counterparts. This is a gross understatement of the problem and the resources allocated to address it. Part of the mission of the FBI InfraGard program is to maintain a public-private partnership with the civilian operators of US national critical infrastructure to thwart cybercrime and cyber threats against the USA. The US Secret Service maintains an Electronic Financial Crimes Task Force (EFCTF) to pursue financial cybercrimes. The budget for these efforts far exceeds several billion dollars annually.

Yet our election security depends on temporary workers with very minimal training and no requirement for cybersecurity knowledge, training or certification. DoD requires thousands of security professionals. Is our election infrastructure less important?

The ability to obtain access to a computer without a password is a persistent problem and will continue to be because computers are programmed by humans; and humans are not perfect, they make mistakes.

Unfortunately, there are enough nefarious people in the world exploiting these weaknesses for their own benefit, that this problem is not likely to ever end.

APPENDIX L. SUPPLY CHAIN SECURITY THREAT AND FOREIGN MANUFACTURING

The United States is a significant target of espionage from foreign adversaries. According to the US Director of National Intelligence in their Supply Chain Risk Management Best Practices[104] document,

> "The U.S. is under systematic assault by Foreign Intelligence Entities (FIEs) who have augmented traditional intelligence operations with nontraditional methods, including economic espionage, supply chain exploitation, and the use of students, scientists, and corporate employees, to collect both classified and unclassified information. The scale of this effort has put entire industries at risk. Specifically, the globalization of supply chains presents a major attack vector, characterized by a complex web of contracts and subcontracts for component parts, services, and manufacturing. FIEs use this complexity to obfuscate efforts to penetrate sensitive research and development programs, steal vast amounts of personally identifiable information (PII) and intellectual property (IP), and insert malware into critical components. Supply chain exploitation, especially when executed in concert with cyber intrusions, malicious insiders, and economic espionage, threatens the integrity of key U.S. economic, critical infrastructure, and research/development sectors."

With the growth of global competition, industry in the US is driven to source materials, components, and finished goods from other countries where costs are significantly lower. However, FIEs continue to insert operatives into these foreign supply chains to the USA where they might be strategically positioned to infiltrate supplies using espionage techniques, including inserting surveillance devices into manufactured goods.

This activity includes the contamination of manufactured electronic components with surveillance devices that record and retransmit audio, video and computer data to their foreign controllers.

Presidential Executive Orders 13959 [105] signed by President Trump declared a National Emergency (Addressing the Threat From Securities Investments That Finance Communist Chinese Military Companies) and Presidential Executive Order 14032[106] signed by President Biden continued and expanded that National Emergency, banning investment in listed foreign companies. These include manufacturers like Huawei, China Telecom, cellphone manufacturers and electronics manufacturers that have conducted espionage against the US by means of installing covert surveillance devices in equipment during its manufacture.

Infiltration of the supply chain includes the use of hardware and software alterations to systems. The SolarWinds attack on the US Government involved a software infiltration of the supply chain.[107]

---

[104] https://www.dni.gov/files/NCSC/documents/supplychain/20190405-UpdatedSCRM-Best-Practices.pdf
[105]   https://www.federalregister.gov/documents/2020/11/17/2020-25459/addressing-the-threat-from-securities-investments-that-finance-communist-chinese-military-companies
[106]   https://www.federalregister.gov/documents/2021/06/07/2021-12019/addressing-the-threat-from-securities-investments-that-finance-certain-companies-of-the-peoples
[107] https://www.asisonline.org/security-management-magazine/articles/2021/03/spies-in-the-supply-chain/

These alterations of hardware and software are incredibly sophisticated. The alteration of electronic computer chips to plant malicious circuitry [108] in the design of silicon integrated circuits has been demonstrated at the University of Michigan.[109]

FBI Director Christopher Wray stated that Chinese spying in the U.S. is so widespread the FBI must launch two counterintelligence investigations a day to counter it.[110] China is focused on stealing U.S. technology to increase its capabilities while shortening the research and development time. The FBI currently has over 2,000 active counterintelligence cases related to China.

Bloomberg reported about China's infiltration of the motherboards of Supermicro computers, [111] manufactured outside the United States and how the insertion of a small chip on the motherboard compromised dozens of companies in the US.

The use of components fabricated, assembled and, or manufactured outside the US, whether furnished as individual parts, assemblies or finished goods, exposes them to the risk of foreign exploitation.

As Bloomberg claimed about the exploitation of Supermicro computers, sourcing components from foreign suppliers presents a supply chain risk that can only be avoided by domestic sourcing.

Statement from Colorado Secretary of State's Office Regarding an Official Order to Appoint Sheila Reiner and an Advisory Committee to Supervise Mesa County Elections

Denver, August 17, 2021 - Today, the Colorado Secretary of State's office issued an Order to appoint Mesa County Treasurer Sheila Reiner to supervise all conduct of the Mesa County elections and establish a three-person advisory committee including Representative Janice Rich, Ouray Clerk and Recorder Michelle Nauer, and former Secretary of State Bernie Buescher to advise and assist Reiner in her duties.

"The people of Mesa County deserve safe and secure elections. I am confident that with these appointments, voters in Mesa will be able to exercise their constitutional right to have their voices heard in our democracy. As Secretary of State, my top priority is to ensure all election security protocols are followed and to safeguard Coloradans' right to vote and we will continue to conduct the business required of our office to provide oversight, to ensure the integrity of the state's elections," said Colorado Secretary of State Jena Griswold.

"In light of the ongoing investigation into the chain-of-custody and election security protocol breach in Mesa County, the Colorado County Clerks Association supports the Colorado Secretary of State's designation of an interim election official to conduct and oversee elections in Mesa County until the investigation is complete. While unusual, this important step of placing a top-notch election expert in the office will ensure a safe and secure election

is conducted for the citizens of Mesa County," said Matt Crane, Executive Director of the Colorado County Clerks Association.

While Department of State staff is continuing to conduct analysis and awaiting additional information, as well as the outcome of a criminal investigation, several facts have prompted substantial concern regarding the ability of the Mesa County Clerk and Recorder's office to execute an election in compliance with statute and rule. Of particular concern:

- Mesa County authorized a non-employee, Gerald Wood, to attend the May 25, 2021 trusted build, in clear violation of Election Rule 20.5.4. The Department has confirmed that this individual was present at the May 25, 2021 trusted build event. The Department has determined that Mesa County Clerk and Recorder employees Belinda Knisley and Sandra Brown participated in facilitating the improper presence of this non-employee during the trusted build event by misrepresenting the individual's employment status and role.
- Footage, both video and photos, was posted online showing the BIOS passwords for Mesa County's voting system. The Department knows from the timestamp on the video and from other evidence that it is likely this sensitive information was filmed and collected during the limited access trusted build installation in Mesa County on May 25, 2021. This meeting was limited only to a minimal number of Department of State staff, voting equipment vendor staff, and three individuals approved to attend by Mesa County: Clerk Tina Peters, Sandra Brown, and Gerald Wood.
- Video surveillance of the Mesa County voting equipment was not continuous and cannot confirm chain of custody of voting equipment. The evidence suggests that an individual in the Mesa County Clerk's office directed Mesa County staff to turn off video surveillance of the voting equipment prior to the May 25, 2021 trusted build. The video surveillance cameras were not turned back on until well after the trusted build had been completed, which is inconsistent with the Department's understanding of the normal course of business practice in Mesa County.
- Two hard drive images from Mesa County election servers were released on the internet during the week of August 9, 2021. Analysis confirms that these images belong to Mesa County hard drives and were created before and after the May 25, 2021 trusted build. The only method to make such copies is to physically access the machines.
- One of the hard drive images is believed to have been taken on Sunday, May 23, 2021. The Department has confirmed that Clerk Peters, Sandra Brown, and Gerald Wood accessed the area where election equipment was stored outside of normal work hours on May 23.

At this time, it is clear that the facts uncovered in the Mesa County Clerk and Recorder's office require that the Secretary of State exercise her authority as Colorado's chief election official pursuant to 1-1-107, C.R.S. to supervise all elections occurring under the authority of Title 1 of the Colorado Revised Statutes in order ensure compliance with all election statutes and rules.

Effective immediately and until revoked by the Secretary of State through subsequent order, Sheila Reiner the Mesa County Treasurer and former Mesa County Clerk will supervise all

conduct related to elections occurring under the authority of Title 1 of the Colorado Revised Statutes. The newly formed advisory committee will be responsible for advising and assisting Reiner and will include Representative Janice Rich, Ouray Clerk and Recorder Michelle Nauer, and former Secretary of State Bernie Buescher.

The committee will participate in weekly meetings with Ms. Reiner during the preparation for and execution of an election, unless Ms. Reiner and the committee decide upon another frequency. The committee shall also be permitted to participate in election functions as designated by Ms. Reiner. The Mesa County Clerk and Recorder and staff will take any and all lawful direction from Ms. Reiner and any other Secretary of State designee on any and all election matters.

Given the deadline to purchase, certify, and install trusted build on election equipment before August 31st, a swift appointment was required to ensure safe and secure elections in Mesa County.

The foregoing Forensic Examination and Report was prepared by me and I am responsible for its content.

This _28th_ day of February, 2022.
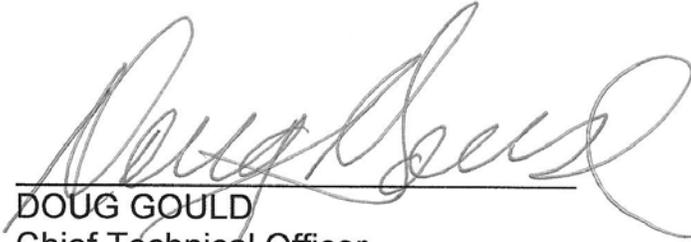

DOUG GOULD
Chief Technical Officer
CyberTeamUS

Doug Gould Biography

Doug Gould is an expert in Cyber Security with more than 40 years' experience in the field. Doug retired from AT&T after 31 years, where he served as Chief Cyber Security Strategist. He currently serves as Chief Technical Officer at CyberTeamUS.

Doug began at AT&T with Bell Laboratories, serving in the Semiconductor Laser Development department and later in the Bell Lab's Security Group, as a delegate to the Bell Labs' Unix Systems Subcommittee, was an early pioneer in the field of Computer Forensics and won a Bell Labs Innovation Award. At AT&T he designed the security architecture for one of the largest states in the US, consulted with cabinets of the nations' largest corporations and designed the first healthcare network fully compliant with Healthcare Information Exchange standards. Outside AT&T, he has overseen security for a US Government Agency and has solved major cases for the FBI and Secret Service; he has served as an Officer of the Court as a forensic expert and has been an expert witness in landmark cybersecurity cases. He designed security architectures for DoD networks including some of the most sensitive areas of the Government. Doug has owned and led several professional services firms in the Information Security field. He served on the NC Council for Entrepreneurial Development and has consulted with many companies about the complex integration of business and technology.

Doug is the past president of Eastern North Carolina InfraGard, the public-private partnership between the nation's critical infrastructure operators and the US Intelligence community.

Doug's background is at the Master's level in Electrical Engineering, Computer Science, Computer Security and Business Administration.

He is a subject matter expert in:
- Strategic Enterprise Security
- Security Architecture & Design (including network Micro-Segmentation)
- Security Governance
- Risk Management
- Security Device Technologies (Firewalls, IDS/IPS, DLP, SIEMs, Encryption, VPNs, Unified Threat Management, etc., Enterprise, Remote and Cloud)
- Information Forensics (Computer & Network Forensics)
- Public Key Infrastructures
- Identity and Access Management
- Authentication, Authorization and Access Control (incl Biometrics)
- Regulatory Compliance
- Physical Security (Threat Assessment/Risk Analysis, TSCM, Access Control, Counterterrorism & Counterintelligence, facility and site protection)
- Business Continuity & Disaster Recovery Planning
- Response & Recovery Strategy
- Threat Intelligence
- Intelligence Analysis

Doug served as Chief Information Security Officer at the World Institute for Security Enhancement, has written advanced security courses, developed advanced security methodologies and has taught government, private sector professionals and law enforcement agents information security, computer forensics, advanced computer forensic sciences and Technical Surveillance Countermeasures (TSCM).

Doug holds numerous certifications in security including the CISSP and Certified Anti-Terrorism Specialist (CAS), as well as numerous instructor certifications in security.

Doug currently serves as Chief Technical Officer at CyberTeamUS.

He is a Vietnam-era US Navy Veteran where he worked in Electronic Warfare and Electronic Intelligence.

Doug is an invited conference speaker.

Doug Gould Forensic Addendum

Major Forensic Cases

- 1986 – Disclosure of National Security Information
  Discovered a leak of highly classified information and was able to identify the perpetrator within a group of 15 people.   The FBI and US Naval Investigative Service brought this to resolution.
- Early 1990's – US Secret Service investigation, "Mothers of Doom" hacker case
  At USSS Evidence Lab, in response to a request for assistance from USS SA Jack Lewis, performed evidence recovery and identified 800 pages of evidence, invalidating immunity of a suspect's testimony in a proffer session.
- Late 1990's – Interpath, a North Carolina Internet Service Provider (ISP)
  This ISP was a tier-1 (top level) provider infected with Stacheldraht malware. Investigated the live (running) server and identified that all evidence on disc had been deleted. The only remaining evidence was a running program in memory, which was recovered. This case changed the Best Practice in Forensics – no longer is the first step necessarily removing the power. Had that been done no evidence would remain in this case.
- Late 1990's – As senior security administrator for the US EPA, investigated a complaint from the White House of computer intrusions and discovered an international attack involving 4 countries. Wrote monitoring and tracking software to capture the perpetrator online, brought together the FBI, Royal Canadian Mounted Police (RCMP), Scotland Yard and Deutche Bundespost in a live investigation tracking the intruder resulting in an arrest in Germany.
- South Carolina – A Public Works supervisor accused of violation of county policy was fired and brought countersuit. Forensic investigation recovered 4 3" thick binders of evidence showing sexual misconduct. Countersuit dismissed.
- Discovered Al Qaida attack plans targeting US Soil. Working with the FBI, the perpetrator, who was a foreign citizen in the US. Arrest made within 48 hours and the attack was thwarted.
- Mid-2000's – Florida vs. Rabinowicz – in a case where possession of contraband was the only element of proof, stipulated that the contraband was authentic and present. I proved forensically that the defendant was not technically in possession of the evidence and that evidence was planted. Qualified as an expert witness and provided expert testimony in this case.
- Mid-2000's – Identified a leak of national security from Oak Ridge National Laboratory involving chemical weapon information using forensic analysis and was able to identify the perpetrator. DSS responded and resolved the case.
- Mid-2000's – Investigated sabotage of a health industry contractor. The systems administrator had been fired and sabotaged the system. Solved the case and the administrator went to prison.

Instructor of Forensics

- Taught Forensics and Advance Forensic Techniques to State Law Enforcement, Military and major corporate customers at the World Institute for Security Enhancement.
- Taught Technical Surveillance Countermeasures (TSCM) course for government and industry at the World Institute for Security Enhancement.

Wrote the entire course and taught the entire CISSP curriculum at Able Information Systems.

**COMMENTS ON APRIL 15, 2022 PROPOSED RULES AS
REVISED MAY 18, 2022**

8 CCR 1505-1

Submitted by Douglas Gould

May 23, 2022

Introduction

I performed a forensic analysis of the Mesa County Dominion Voting Systems (DVS) Election Management System (EMS) server and submitted two forensic reports to the court (via counsel) entitled "Mesa County Colorado Voting System Report #1" (hereafter referred to as "Report #1") and "Mesa County Colorado Voting System Report #2" (hereafter referred to as "Report #2) which are incorporated fully herein.

I also wrote a letter to Mr. John Case dated March 11, 2022 regarding Dominion Voting Systems Democracy Suite 5.13, which is also incorporated herein.,

Comments on the Proposed Rules:

In Colorado, voting systems are required by law to comply with the 2002 Voting Systems Standards (VSS) published by the Federal Election Assistance Commission (EAC). The proposed rules do not comply with the VSS and would cause non-compliance with the law.

Election Records are required by the VSS to be preserved for 22 months but both DVS D-Suite 5.11-CO and DVS D-Suite 5.13-CO fail to meet this requirement.

The VSS states in Volume 1, page 2-34, section 2.2.1.1, Data Retention, with respect to United States Code Title 42, Sections 1974 through 1974e that:

"Because the purpose of this law is to assist the Federal government in discharging its law enforcement responsibilities in connection with civil rights and elections crimes, its scope must be interpreted in keeping with that objective. The appropriate state or local authority must preserve all records that may be relevant to the detection and prosecution of federal civil rights or election crimes for the 22-month federal retention period, if the records were generated in connection with an election that was held in whole or in part to select federal candidates. It is important to note that Section 1974 does not require that election officials generate any specific type or classification of election record. **However, if a record is generated, Section 1974 comes into force and the appropriate authority must retain the records for 22 months.**"

The same section further states:

"Regardless of system type, all audit information spelled out in section 4.5 of the Standards **shall be retained in its original format,** whether that be real-time logs generated by the system, or manual logs maintained by election personnel. The election audit trail includes not only in-

process logs of election-night (and subsequent processing of absentee or provisional ballots), but also time logs of baseline ballot definition formats, and system readiness and testing results."

In Report #1, I documented the finding of fact that DVS D-Suite 5.11-CO is configured to record only 20 megabytes of log data before overwriting the log file and thus destroying all prior records. In my letter to Mr. Case dated March 11, 2022, I documented that DVS D-Suite 5.13-CO is programmed in precisely the same manner as delivered by DVS immediately following its installation by the vendor and Secretary of State personnel.

To put this in context, the Voluntary Voting Systems Guidelines (VVSG) issued by the National Institutes of Standards and Technology (NIST) states that a system should provide a minimum of 20 gigabytes of storage for log files, and at least twice the amount of storage space that is anticipated to be needed. While VVSG compliance is not required by Colorado law, it none the less serves as a robust example of the **minimum** reasonable configuration of Voting Systems logging capability.

In my examination of D-Suite 5.13-CO, it was noted that one single entry in a typical log consumed 68 kilobytes. Dividing the size of one log entry into the available 20 megabytes of storage results in a log capacity of 294 log entries. A busy computer can easily generate this many logs in a single minute, and often in only several seconds.

The configuration of the logging systems in the Mesa County system is 3 orders of magnitude, or 1,000 times, less than NIST indicates is reasonable and required.

To put this in context, lets consider the example of automobile mileage as follows: (for the purpose of illustration) an average car achieves 20 miles per gallon of fuel, and holds 20 gallons of fuel. This gives the car a travel range of 400 miles without refueling. One order of magnitude less would be $(20 \div 10)$ 2 gallons of fuel, which would transport the vehicle 40 miles. Two orders of magnitude less would be 0.2 gallons of fuel, which would transport the vehicle 4 miles. Three orders of magnitude less would be 0.02 gallons of fuel, or 2.56 ounces of fuel, which would transport the vehicle 0.4 miles, or approximately 704 yards. Four hundred miles versus 704 yards, less than ½ mile: keep this ratio in mind in understanding the fact that Colorado Voting Systems are configured to hold 1,000 TIMES LESS than the recommended amount of log data.

Chain of Custody is addressed extensively in the management of election records, the most obvious of which being ballots themselves. The purpose of a chain of custody is to maintain accountability for the handling of election records and to allow for the testimony of the custodians of the records to verify that the records were received, stored and / or transported and delivered without any modification.

When a ballot is surrendered to an election management system, it is scanned into a digital image (e.g., picture), interpreted by the computer system (and when necessary, by election judges), and then tabulated, in addition to any other processing that occurs. No human is capable of directly observing the digital manipulation of the bits and bytes of data inside the computer system; thus, the computer generates a record of its actions, and stores these records into log files. To verify

how the computer processed these ballots, it is necessary for the entire set of logs to be examined. This entire set of log information documents what users were present, how they were connected, what programs or applications they executed, as well as what the programmed software of the system did, how it processed the ballots, how it added or tabulated them and how each exception was handled.

No human can accurately determine the actions taken by the computer without these log files. It is the examination of the total set of this log data that we refer to as an Audit. Due to the enormous complexity of computer systems, no audit can accurately verify correct operation of a computer system absent its log files.

Colorado voting systems do not store a complete set of election records and are not in compliance with Federal and State law. Colorado Secretary of State instructions do not provide for a complete forensic copy of the voting system adequate for the prosecution of election crimes, despite the fact that the Secretary of State is charged in Federal Law with the responsibility "to assist the Federal government in discharging its law enforcement responsibilities in connection with civil rights and elections crimes." Noted in conjunction with my prior statement regarding the retention of records in their originally generated form, see Fed. R. Evid. 1002, the Best Evidence rule, which codifies the original record as the best evidence.

In Report #2, I examined D-Suite 5.11-CO and demonstrated the failure of security mechanisms to protect election records. Many hundreds of configuration parameters are required to be properly configured in order to secure a computer system, not only in the operating system, but within its security software and application software. Further programming mistakes create system weakness that can be readily exploited to gain access and execute programs. Rather than present several hundred configuration settings and present the court with the challenge of finding fact among disagreeing experts, given that the security configuration of the voting system was so egregiously weak, I demonstrated the weakness by actually breaking in to a virtual copy of the system and proving its inability to protect voter data.

The proposed rules are wholly inadequate. Colorado Voting Systems fail to adequately preserve computer-generated original election records. The rules should be written such that not only is appropriately strong security implemented but that records are retained that would support a criminal prosecution as required by law, rather than erasing those records. Chain of custody MUST include all the actions taken by the computer to the Vote Data and its processing.

To do less is to ensure that elections cannot be validated as having integrity and fairly representing the will of the people.

Report #3
Election Database and Data Process Analysis
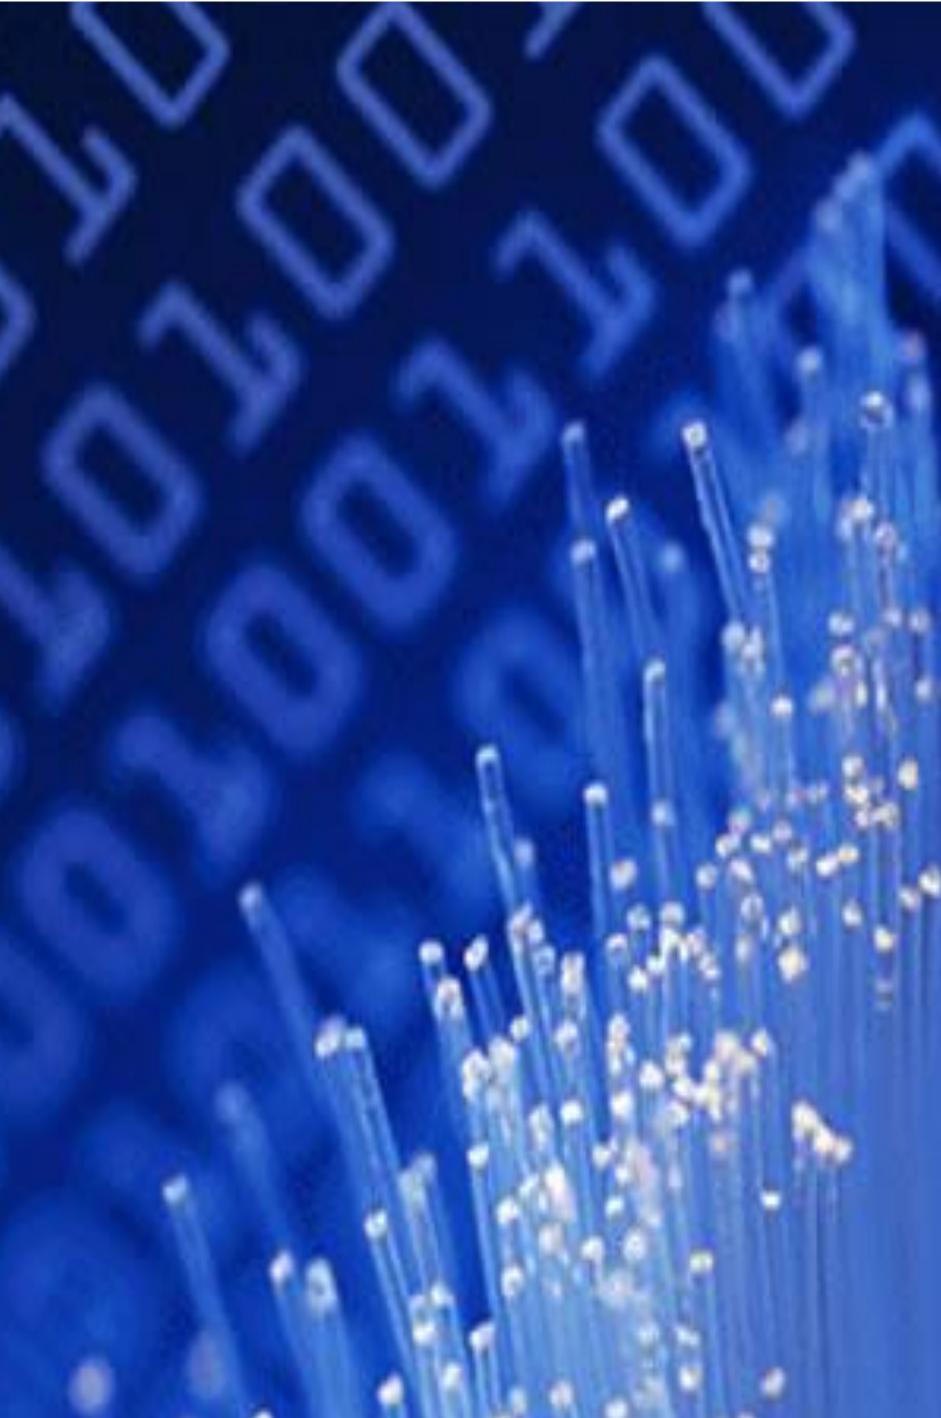

March 19 2022

Table of Contents

EXECUTIVE SUMMARY

This report documents the findings of an examination of tabulated vote databases based on forensic analysis of the drive image of Mesa County, Colorado's Dominion Voting Systems (DVS) Election Management System (EMS) server. The findings in this report were prepared by the authors as consultants to the legal team representing Tina Peters, the Mesa County Clerk and Recorder, pursuant to her statutory duties as Mesa County's Chief Election Official. The findings provide evidence of potentially unauthorized and illegal manipulation of tabulated vote data during the 2020 General Election and 2021 Grand Junction Municipal Election. Because of this evidence, which led to the vote totals for those elections being impossible to verify, the results and integrity of Mesa County's 2020 General Election and the 2021 Grand Junction Municipal Election are in question.

This analysis was performed using the forensic image of the EMS server, which was backed up before Colorado Secretary of State and DVS overwrote the hard drive with D-Suite version 5.13.

Findings and Implications:

1) There was an unauthorized creation of new election databases during early voting in the 2020 General Election on October 21, 2020, followed by the digital reloading of 20,346 ballot records into the new election databases, making the original voter intent recorded from the ballots unknown. In addition, 5,567 ballots in 58 batches did not have their digital records copied to the new database, although the votes from the ballots in those batches were recorded in the Main election database.

2) The same unauthorized creation of new election databases occurred during the 2021 Grand Junction Municipal Election on March 30, 2021, followed by the digital reloading of 2,974 ballot records, making the original voter intent recorded on those ballots unknown. In addition, 4,458 ballots in 46 batches did not have their digital records copied to the

new database, although the votes from the ballots in those batches were recorded in the Main election database.

3) The absence of secure hash algorithm (.sha) files for each digital ballot image makes the authenticity of each digital ballot image, and the ballot-level record for those ballots, impossible to verify.

4) The true total vote count in Mesa County, Colorado cannot be accurately calculated for the 2020 General Election or the 2021 Grand Junction Municipal Election from records in the databases of the county's voting system.

5) There is no function or feature on the EMS server that could be executed inadvertently or deliberately by a local election official that would cause this combination of events to occur, especially within the time frame that these events occurred. Given the complex sequence of data manipulations and deletions necessary to produce the digital evidence described in this report, this combination of events could not have been the result of either deliberate or inadvertent actions by those officials.

6) Dominion's installation of the Trusted Build update on the EMS in May of 2021, as ordered by the Colorado Secretary of State, destroyed all data on the EMS hard drive, including the batch and ballot records that evidenced the creation of new databases and reprocessing of ballot records described in Findings 1 and 2 above. This destruction of all data by the trusted build is described in the "Mesa County, Colorado Voting Systems Forensic Examination and Analysis Report".

7) The fact that such ballot record manipulation has been shown demonstrates a critical security failure with the DVS EMS wherever it is used. The manipulation would not be identifiable to an election official using the voting systems, nor to an observer or judge overseeing the election conduct, much less to citizens with no access to the voting systems; without both cyber and database management system expertise, and

unfettered access to database records and computer log files (many of which were destroyed by the actions of the Secretary of State) from the EMS server, the manipulation would be undetectable.

INTRODUCTION

The use of computerized election management systems is now nearly universal across counties in the United States. While the use of these systems is touted as "efficient", potentially decreasing manpower costs and time to produce election results, it also greatly reduces the transparency of the election process and exposes our elections to extraordinary vulnerability from both inadvertent and deliberate misconfiguration or misuse. Americans' right to free and fair elections is inalienable, but that right is infringed by lack of transparency, and by whatever lies behind that opaque curtain.

Without free and fair elections and the transparency to see it for themselves, without relying on the assertions of any other person or organization, Americans' consent and the legitimacy of our government, at all levels, is in doubt. If Americans' votes are to be recorded and counted by machines, every aspect of those machines' operation, configuration, and data must be recorded, immediately available at no cost or administrative burden to citizens and their independent examiners and confirmed 100% accurate through that independent verification. The absence or shortfall of any of those three imperatives (recorded, available, and independently verified) should immediately cause the public to distrust both the purported result from those machines, and also anyone who insists that they accept those results.

Numerous Federal and State laws attempt to safeguard our voting rights and the integrity of our elections. Title 52 USC provides for much of the Federal guidance in this area, and Colorado Revised Statute (CRS) Title 1 covers most of the Colorado state guidance.

a) 52 U.S. Code § 10307 prohibits any person acting under color of law to "…willfully fail or refuse to tabulate, count, and report…" the vote of any person entitled to vote.

b) 52 U.S. Code § 10308(a) prescribes penalties for any person depriving or attempting to deprive any person of voting rights under Federal statute.

c) 52 U.S. Code § 10308(c) prescribes penalties for conspiring to violate or interfere with secured voting rights.

d) 52 U.S. Code § 20701 mandates the preservation of all election records for 22 months after an election for Federal offices.[1,2]

e) 52 U.S. Code § 20702 prescribes penalties for theft, destruction, concealment, mutilation, or alteration of § 20701 election records.

f) 52 U.S. Code § 21081 requires that voting systems used in elections for Federal office meet the standards of that section, including that the voting system shall produce a record with an audit capacity for such system, and that "the error rate of the voting system in counting ballots…shall comply with the error rate standards established under section 3.2.1 of…" the Federal Election Commission 2002 Voting System Standards (VSS).[3]

g) CRS §1-5-601.5 requires that voting systems and equipment in Colorado meet 2002 VSS standards, at minimum.

h) CRS §1-7-802 requires the preservation of election records for 25 months after elections.

i) CRS §1-13-111 prescribes penalties for destroying, removing, or delaying delivery of election records.

Title 52 clarifies that the "every officer of election" is responsible for maintaining the election records.

---

[1] U.S. Department of Justice Publication "Federal Law Constraints on Post-Election 'Audits'," July 28, 2021, states that "The materials covered by Section 301 extend beyond 'papers' to include other 'records.' Jurisdictions must therefore also retain and preserve records created in digital or electronic form."

[2] The Federal Election Commission's 2002 Voting System Standards, the standards of which are mandatory minima for certification of voting systems under Colorado state statute § 1-5-601.5., specifies that a voting system which "…provides access to incomplete election returns and interactive inquiries before the completion of the official count…shall: a. …be designed to provide external access to incomplete election returns only if that access for these purposes is authorized by the statutes and regulations of the using agency…b. Use voting system software and its security environment designed such that data accessible to interactive queries resides in an external file, or database, that is created and maintained by the elections software under the restrictions applying to any other output report, namely, that: 1) The output file or database has no provision for write-access back to the system. 2) Persons whose only authorized access is to the file or database are denied write-access, both to the file or database, and to the system," and states that the Standards are "intended to address…risks to the integrity of a voting system...," including "…Changing calculated vote totals;…" and "Preventing access to vote data, including individual votes and vote totals, to unauthorized individuals;…"

[3] 2002 VSS, para 3.2.1 specifies "d. For central-county systems…: Consolidation of vote selection data from multiple counting devices to generate jurisdiction-wide vote counts, including storage and reporting of the consolidated vote data…a target error rate of no more than one in 10,000,000 ballot positions." A ballot position is each and every choice (e.g. a "bubble" which can be marked or filled-in) on a ballot selectable by a voter to convey their voting choices.

Mesa County, Colorado, uses software and hardware provided by DVS and for the 2020 General Election and the 2021 Grand Junction Municipal Election, specifically used "D-Suite 5.11-CO." The primary voting system EMS server, which contains the raw tabulated vote information used to produce official election reports, makes use of Microsoft SQL Server 2016 databases running on the Microsoft Windows Server 2016 operating system. The forensic image used for the analysis, created on May 23, 2021, has been validated as authentic.

DEFINITION OF TERMS

"Ballot": Mesa County used two-sided paper ballots in the November 2020 General Election and the 2021 Grand Junction Municipal Election. A ballot is a device used to cast votes in an election. In Colorado, ballots are pieces of paper defining races and issues, and reflecting the choices of individual voters from among the options available for each race and issue. A digital image of each paper ballot is created by the DVS D-Suite voting system during the processing of ballots, as described below, and that ballot image is stored on the designated "NAS (Network Attached Storage device)" of the D-Suite voting system.

"Adjudication": A term used to describe the process of determining voter intent from a voter's ballot marks, where ballot markings are ambiguous. According to Dominion's Democracy Suite Use Procedure Manual, adjudication is "the process of examining voted ballots to determine, and, in the judicial sense, adjudicate voter intent". In the DVS D-Suite, adjudication refers to the operation and use of a software component called "EMS Adjudication," and the process of using that software component to manually or automatically interpret voter intent from scanned ballot images, and then to record that interpretation as the record of the vote choices for the affected ballots, in both "result files" and ballot images. Depending on software configuration choices, individual ballot images/result files, entire batches of ballot images/result files, or all ballot images/result files can be subjected to automatic or manual adjudication on the basis of "exceptions" or "outstack conditions" (e.g., "overvotes", where too many choices are marked for a race or issue; or "marginal marks" when ballot choice ovals are not adequately filled in), or by the arbitrary decision of EMS administrators.

"Manual Adjudication": Either all ballot images, or individual ballot images, or those from particular batches or tabulators, in which voter intent for any race or issue is flagged by the EMS Adjudication software module as not being determinable (or as having "exceptions"), are, in theory, sent to "Manual Adjudication" stations where officials called "Adjudicators" view the digital images of the ballots and decide the voter's intent. In this Report we sometimes use the terms "manual adjudication" and "machine adjudication" to clearly distinguish the process of human judging of voter intent from the process of the DVS EMS Adjudication software's determining of voter intent.

"Adjudication database": The DVS D-Suite version used in Mesa County during the November 2020 and April 2021 elections maintains a separate SQL Server database, called an "AdjudicableBallotStore," created by DVS software, for each election which contains records of all batches and ballots scanned into the voting system through ImageCast scanning workstations, and any batch and ballot records manually entered. The database maintains critical information about each batch and ballot, most importantly the ballot Adjudication status and the file location of the ballot image. A batch can have any of the following adjudication statuses in the adjudication system: In-Progress, Read Error, Review, Pending Submission, Submitted, or Submission Error.[4] Throughout, "Adjudication database."

"Main election database": The DVS D-Suite version used in Mesa County during the November 2020 and April 2021 elections maintains a database for each election, called an "ElectionStore" by DVS, which contains information defining an election, including contest, candidate, and ballot definitions as well as aggregated vote information which is used to produce all election reports generated by County officials. Throughout, "Main database."

"Tabulation database": The DVS D-Suite version used in Mesa County during the November 2020 and April 2021 elections maintains a database for each election,

---

[4] In-Progress batches have been acquired by the system (e.g. through scanning at an ICC) and have ballots being served to clients (Adjudication); Read Error batches are those which encounter errors while being loaded into the system; Review are batches with all ballot adjudication complete, including batches with no adjudication required; Pending Submission are batches submitted to tally, but which have not yet completed that transmission to the tally process; Submitted are batches which have completed the transmission to the tally process; Submission Error are batches that were submitted to the tally process, but which were unsuccessfully submitted.

called a "TabulationStore" by DVS, which contains the timestamps and ballot counts for each batch of ballots, which duplicates that information contained in the Adjudication database. It contains other tables which are not used by Mesa County's elections. Throughout, "Tabulation database."

"Reprocessed": For the purposes of this Report, the term "reprocessed" means that one or more data records which had already been created, presumably by scanning of paper ballots through an ImageCast Central (ICC) workstation, though also technically possible through manual entry of records, within the databases associated with an election, were loaded into the system *again* to a different database, and that this re-loading was not performed in connection within any documented, authorized election-related operations procedure or function. A comparison with the log files of the respective ICC workstations might reveal whether the reprocessed paper ballots were, in fact, rescanned at the ICC, but many of those log files have been destroyed by the Secretary of State's "Trusted Build."

ANALYSIS

I.   Evidence of ballot record data manipulation – November 2020 General Election

Our analysis shows manipulation, which was neither initiated nor authorized by Mesa County election clerks, of the batches and ballots processed during the first three days of ballot processing in the November 2020 General Election.

The following timeline of events, beginning October 19, 2020, when Mesa County began processing ballots in the General Election, demonstrates this manipulation of ballots.

October 19, 2020 – October 21, 2020, 2:14 PM

On these first three days of ballot counting in Mesa County, up until 2:14 PM on October 21, 2020, 267 batches, consisting of 25,913 ballots, were physically processed (physically scanned on DVS ICC scanners with voters' choices, in the

form of marks on the ballots, scanned and interpreted by software) through three tabulators, internally identified in the Main database as tabulator IDs 4, 7, and 10. Mesa County election clerks reported no unusual activity or errors encountered during the processing of these 267 batches. The Adjudication database used at this time contains records of all batches with a sequential "load order" of 1 to 267, and other tables within it record the information about each ballot, for instance the time it was entered into the database, the tabulator used, and the adjudication status. Those which were selected for Adjudication have the proper status records indicating that the normal adjudication steps occurred.

The initial 10 batches processed through tabulator 10, containing a total of 941 ballots, had timestamps indicating that they were all entered into the database within 47 seconds (total – not 47 seconds per batch, but 47 seconds for 10 batches). (See Appendix A for a list of the batches and their timestamps in the **original** Adjudication database.) The Canon DR-G1130, which according to purchasing documents and Colorado Secretary of State voting equipment inventories is the model of scanners used by Mesa County (see Reference C and the Colorado Secretary of State website[5]), operates at approximately 100 pages per minute (ppm), duplex, meaning that scanning both sides of each ballot would take no less than 0.01 minutes, which is 0.6 seconds, per ballot. 941 ballots at 0.6 seconds per ballot should have taken a minimum of 564 seconds, or slightly under 9 and a half minutes, a significantly longer interval than 47 seconds, which is physically impossible. Mesa County election clerks were unaware of these batch timestamps, or any issue which could explain them.

October 21, 2020 - 2:14 PM

According to the data contained in the EMS SQL Server Database, new Tabulation and Adjudication databases were created on the EMS server at 12:18:50 PM October 01, 2020. These databases initially contained no data records.

Figure 1. "Before" Screenshot of Databases on the Mesa EMS Server

	name
1	2020 Mesa County General-2020-09-05-00-10-20
2	AdjudicableBallotStore_2020_Mesa_County_General_2020-10-01_12:18:50
3	TabulationStore_2020_Mesa_County_General_2020-10-01_12:18:50

One Adjudication database and one Tabulation database were listed, with creation times before the counting in Mesa County began on October 19, 2020.

Figure 2. "After" Screenshot of Databases on Mesa EMS Server

	name
1	2020 Mesa County General-2020-09-05-00-10-20
2	AdjudicableBallotStore_2020_Mesa_County_General_2020-10-21_14:18:51
3	TabulationStore_2020_Mesa_County_General_2020-10-21_14:18:51
4	AdjudicableBallotStore_2020_Mesa_County_General_2020-10-01_12:18:50
5	TabulationStore_2020_Mesa_County_General_2020-10-01_12:18:50

Two Adjudication databases ("AdjudicableBallotStore") and two Tabulation databases ("TabulationStore") are now listed, one set of which had creation times before the date and time ballot scanning and tabulation began in Mesa County on October 19, 2020 and the other set of which the EMS server data indicate were created two and a half days *after* ballot scanning and tabulation began.

It has been observed that a clerk giving the EMS system a command to stop and then restart adjudication in an election again creates new Adjudication and Tabulation databases. Mesa County clerks are very certain that they did not initiate any such action in either the November 2020 or the April 2021 elections. Therefore, it is likely that a procedure internal to the DVS software had to perform a stop and restart of the adjudication services in order to perform the batch and ballot manipulation which occurred later (see below).

There are only a few possibilities which would explain how the database copying process was initiated.

1. **Direct action by Mesa County personnel**

   The client application used by election clerks does give them the ability to stop and restart adjudication, which would create the new databases.

   However, Mesa County personnel are very clear that they did nothing of the sort and explained that they would only do such a thing in an extreme emergency, as the process would have made the production of legally mandated reports very difficult.

2. **Triggered remotely**

   "Report #2, Forensic Examination and Analysis Report" by D. Gould identifies numerous security vulnerabilities in the DVS EMS server. A signal, or external trigger,[6] giving instructions to software inside the EMS server could have been sent to and received through any of the open communication ports, or through the port 80 Web Server port, which has been demonstrated to be open on the server and accepting commands via an application programming interface (API).[7] This signal, along with other information, could have been received via a local network connection (from any device connected to the EMS server's internal network), from a remote network connection (if the EMS server's internal network has been bridged to the external internet), or via an internal cellular modem installed in the EMS server. If the EMS Server was connected to a wireless network, it is feasible that even a cell phone outside of the building, but still within the wireless signal radius, could have been used to trigger the events.

   This option is plausible but infers a degree of external, time-sensitive control over the DVS equipment in use in Mesa County. This control might

---

[6] E.g., an "external trigger" most people are familiar with is the function whereby their smartphone's wi-fi connection is turned on in response to detecting the proximity of a saved, pre-approved wi-fi network. The external trigger satisfies the criteria of an internal, saved rule for application behavior, and the application then executes the correlated command or function. We likely don't think of "Do Not Disturb" mode on our smartphones as being similarly controlled by an external trigger, but if our smartphones are configured to "use network time," meaning the time signal transmitted by the cellular carrier network, then our smartphones' "Do Not Disturb" mode isn't turned on at the time we set, per se, but when our cellular carrier tells our phone that the specified time is reached.

[7] An API is a specification for interaction which allows computer applications to communicate with, make requests to, and issue commands to other computer applications. I.e., API enables machine-machine communication, coordination, and command and control, depending on the permissions and allowable exchanges of the specific API specification.

be considered undesirable by the perpetrators responsible for manipulating the election data, because it was a possibility that any unauthorized network connections, whether they be via standard ethernet, wireless network connection, or cellular modem, could have been discovered during the election period.

3. Algorithmically Triggered

A software algorithm[8] running inside the DVS computer systems in Mesa County could have made the decision to perform the new database creations and the selected record manipulation which followed based on preprogrammed criteria related to the election results at the time.

Given that this method requires the least amount of external control and monitoring, this option would seem to be the most likely. The decision to copy the Adjudication and Tabulation databases and re-process the ballot records would be made by software running inside the Dominion EMS (or inside another connected machine running Dominion software) based on unexpected voting patterns.

October 21, 2020, 2:30 PM – 2:34 PM

During this time period, 209 out of the original 267 batches (containing a total of 20,346 ballots) were digitally – not physically – loaded into the new Adjudication and Tabulation databases. Specifically, records for batches with load order 2 through 59 were not reloaded and do not appear in the new Adjudication database in any form. The timestamps of the 209 batch records (load order 1 and load orders 60 through 267) show an impossibly short processing time (approximately 4 seconds each) for these batches to have been physically processed into the newly created Adjudication and Tabulation databases. As described above, because of the minimum scanning time of one

---

[8] An "algorithm" is simply a set of rules for logical, sequential consideration of inputs (e.g. a contingent variable state, like "the switch is off" or "the switch is on," or the value of field/memory location "X" is "1" or is "Not 1") to produce a consistent, expected output. In this case, a simple, hypothetical algorithm might have been something like "IF ('numberofbatches'>50) AND ("ElectionProjectActive"=TRUE) AND ("EMSAdminUserLoggedIn"=FALSE) AND (VOTETOTAL,"InternalMachineID:01">VOTETOTAL,"InternalMachineID:02") AND (SYSTIME>20201019) AND (SYSTIME<20201103) THEN COPY:BATCHID030010:BATCHID030059 AND INSERTINTO "adjudicableballotstore," etc.

minute per batch for the Canon DR-G1130 scanner-based tabulator, it is not possible for these 20,346 ballots to have been physically rescanned (i.e., the paper ballots were not reloaded into the scanning hardware), but rather the digital batch and ballot records were directly added to the new Adjudication database. This indicates that the batches could only have been loaded into the newly created Adjudication and Tabulation databases by using software code or a script running within the EMS server. See Appendix B for a list of all batches and their timestamps in the new Adjudication database. See Appendix C for a list of all commands executed prior to and after the database copy, which provides a precise timeline of the effects of those commands on the database copy.

It is important to note that this unauthorized procedure only copied the records of selected batches of ballots, indicating that this was an intentional act.

Below is a screenshot of the beginning of the list of batches recorded in the original Adjudication database, sorted by the order that they were loaded:

Figure 3. List of Batches Recorded in the Original Adjudication Database, Sorted by Load Order

	TabulatorId	BatchId	Category	CvrBatchId	Name	LoadOrder	CreationTime	ModificationTime
1	10	4001	0	1	Tabulator 10 - Batch 4001	1	2020-10-19 12:07:40.850	2020-10-19 12:09:58.200
2	10	4002	0	2	Tabulator 10 - Batch 4002	2	2020-10-19 12:07:44.443	2020-10-20 10:43:25.547
3	10	4003	0	3	Tabulator 10 - Batch 4003	3	2020-10-19 12:07:48.257	2020-10-20 10:43:26.437

While the record of the batch with load order 1 was copied, there is a gap of 58 batches before the second line, which is a record of the batch with load order 60. Batch load order numbers 2 through 59 were *not* copied, effectively deleting them in the new Adjudication database.

The data records describing the batches and the ballots contained within them in the new Adjudication database, specifically the time stamps shown in Appendix B as well as statements by Mesa County election officials, indicate that the paper ballots and batches were not physically re-scanned. Therefore, it appears the process of scanning these ballots was simulated, and the records of the batches and the ballots contained within them were electronically transferred from the original Adjudication database into the new Adjudication database.

For example, below is the sequence of events detailing the processing of batch 4024 (whose ballots and records were *not* copied to the new Adjudication database) and batch 4025 (whose ballots and records were copied to the new Adjudication database). This will illustrate the contrast between copied and uncopied batch and ballot records.

Batch 4024 is recorded in the original Adjudication database as being created at 4:09:34 PM on October 19. It contained 100 ballots and was scanned by tabulator 10. Ten of these ballots from batch 4024 were subsequently manually adjudicated. The manually adjudicated ballot numbers in the batch which were manually adjudicated were 4, 8, 13, 14, 30, 48, 63, 87, 88, and 90. Then, the votes contained on all 100 ballots were recorded in the appropriate tables in the Main database (see Reference A for a list of these tables). When the new Adjudication database was created, no records from Batch 4024 were copied to it, and thus there was no reprocessing or physical rescanning of the ballots. Adjudication history for the 10 ballots which were manually adjudicated was no longer available to the Mesa County clerks, and the original voter intent of these ballots is unknown.

In contrast, Batch 4025 is recorded in the original Adjudication database as being processed at 4:12:23 PM on October 19. This batch contained 99 ballots and was also scanned by tabulator 10. Fourteen of these ballots were subsequently manually adjudicated. The ballot numbers in the batch which were manually adjudicated were 3, 10, 13, 21, 22, 23, 34, 40, 49, 59, 66, 79, 97, and 99. Then, the votes contained on all 99 ballots were recorded in the appropriate tables in the Main database.

After the new Adjudication database was created, a record of Batch 4025 appeared in its tables at 2:20:26 PM on October 21. It is still listed as having 99 ballots and from tabulator 10. In the new Adjudication database, however, only 6 of the batch 4025 ballots (8 less than the first time these batches were entered into the original Adjudication database), were *again* manually adjudicated. The individual ballot numbers were 3, 21, 22, 40, 59, and 66. At this point, the vote records from at least those 6 ballots and possibly all 99 would have been recorded in the appropriate tables in the Main database, replacing the votes which were already in that database from those ballots. Adjudication history for the 14 ballots which were manually adjudicated was no longer available to the Mesa County clerks, and the original voter intent of these ballots is unknown.

The selected batches in the new Adjudication database (batch 1 and batches 60 through 267) appeared in the same serial order that they were loaded into the original Adjudication database, with the same batch numbers, ballot counts, and load order numbers (compare Appendix A and Appendix B).

October 21, 2020, shortly after 2:34 PM

At this point, as reported by Mesa County election officials, some Mesa County adjudication officials began noticing that they were being asked to look at ballots that they had already adjudicated. This is consistent with these ballots and batches being reprocessed in the new Adjudication database. When the new Adjudication database was created, and the selected records described above were copied and reprocessed, there were outstanding ballots from the last set of batches scanned before the event. As some of these ballots were sent to manual adjudication again after the batches were reprocessed, this caused a situation where the same ballot was in the manual adjudication process twice. This caused confusion among the election staff who were assigned the duty of manual adjudication, since when a ballot was adjudicated the second time the master count of adjudicated ballots, which is displayed by the Dominion system and is used by the election clerks to track the overall adjudication process, did not change. This caused the Adjudication officials to assume that there had been an error and, in some cases, to attempt additional manual adjudications of the same ballot with the same unsatisfactory result.

According to several Mesa County election officials, DVS support was contacted at approximately 4PM on the 21st of October, and while the support representative claimed to not have a solution for the issue Mesa County was seeing, that issue ceased soon afterwards. This indicates that DVS may have performed or caused to be performed an operation unknown to Mesa County election officials (and outside of their control) to address this problem which manifested after the unauthorized database manipulation.

Of the 209 batches which were processed twice (batches 1 and 60 through 267), the ballot counts match between the old and new Adjudication database. However, DVS software marked 2,166 ballots for manual adjudication the first time they were processed in the original Adjudication database, but when reprocessed in the new Adjudication database the software marked only 965 ballots for manual adjudication.

The same ballots run through the same hardware and evaluated by the same software should have had the same resulting ballots marked for adjudication, but they did not. This leads to the logical critical conclusion that not all the ballots in the batches processed after the database copy were the same and had the same votes as the ballots in the same batches processed before the database copy. There is no record remaining of the votes originally recorded from the ballots, and therefore there can be no certainty that the votes now recorded are the same. In essence, the chain of custody has been broken for these votes in the database.

The 58 batches which were *not* duplicated in the new Adjudication database must also be seen as suspect, as their chain of custody has also been broken via the fact that no record of them or their adjudication exists in the Adjudication database in use at the end of the election. A clerk wishing to view the adjudication status of a ballot in any of the 58 batches would be unable to do so, as no information about those batches exists in the new Adjudication database.

Thus, all 25,931 ballot records processed before 2:14 PM on October 21, 2020, comprising over 25% of the County's total over the entire election, cannot be verified and should not have been counted.

II.   Evidence of Ballot Manipulation – April 2021 Grand Junction Municipal Election

Our analysis shows a nearly identical manipulation of the batches and ballots processed during the first six days of ballot processing in the April 2021 Municipal Election in Grand Junction, Colorado.

The timeline of events beginning March 24, 2021, when Mesa County Election clerks began processing ballots in the 2021 Grand Junction Municipal Election, follows.

March 24, 2021 – March 30, 2021, 2:43 PM

On these first seven days of counting, up until 2:43 PM on March 30, 2021, 88 batches of ballots, consisting of 8,540 ballots, were processed. County Election clerks report no unusual activity or errors encountered *at any time* during the election counting process. The Adjudication database used at this time contains records of all batches with a sequential load order of 1 to 88, and other tables within it record each ballot. Those which were selected for Manual Adjudication (339 in total) have the proper status records indicating the normal adjudication steps occurred.

March 30, 2021, 2:58 PM

According to the data contained in the EMS server, new Adjudication and Tabulation databases were created and registered within the DVS system as the associated databases for the election. As in the circumstance previously described in the early voting period for the November 2020 election, these two databases initially contained no data.

See Appendix D for a list of all commands executed prior to and after the database creation in the April 2021 Municipal Election, which provides a precise timeline of the effects of creating the new databases and copying the batch and ballot records.

It is important to note that this unauthorized procedure copied the records of only selected batches of ballots, indicating that this was an intentional act.

Below is a screenshot of the beginning of the list of batches recorded in the original Adjudication database, sorted by the order that they were loaded:

March 30, 2021, 3:00 PM – 3:03 PM

During this three-minute time period, records of 42 batches and the 4,082 ballots contained within them, previously processed into the original Adjudication database, were copied into the new Adjudication database. According to the time stamps, the records of the batches appeared in the new Adjudication database in intervals of a fraction of a second between them, much too quickly for the ballots contained in the batches to have been physically scanned (per the maximum scanning speeds discussed above). Mesa County election clerks state that they did not take any action to reprocess or re-scan any batches on that day, nor did they at any time stop and restart the Adjudication software process. Only 39 ballots in these 42 batches went through manual adjudication after being copied to the new database, and database records indicate that the adjudication process was completed successfully on those 39 ballots.

Unlike what was found in the November 2020 General Election records described above, the records for these 42 batches which were copied to the new database do not appear in the new Adjudication database in exactly the same order as they had originally been loaded; 12 batch records are out of order when the records in the original Adjudication database and the new Adjudication database are compared.

No further anomalies are shown in the Adjudication database records during the Election counting process, nor did Mesa County election clerks encounter any unexpected issues.

Of the 42 batches which were processed twice (batches 45 through 49 and 51 through 88), the ballot counts (total number of ballots) match between the old and new Adjudication databases. However, DVS software sent 339 ballots to manual adjudication the first time they were processed in the original Adjudication database, but when reprocessed in the new Adjudication database the software sent just 39 ballots to manual adjudication.

The same ballots run through the same hardware and evaluated by the same software should have had the same resulting ballots marked for adjudication, but they did not. This leads to the logical critical conclusion that not all the ballots in the batches processed after the database copy were the same and had the same votes as the ballots in the same batches processed before the database copy. There is no record remaining of the votes originally recorded from the ballots, and therefore there can be no certainty that the votes now recorded are the same. In essence, the chain of custody has been broken for these votes in the database.

The 46 batches which were *not* duplicated in the new Adjudication database must also be seen as suspect, as their chain of custody has also been broken via the fact that no record of them or their adjudication exists in the Adjudication database in use at the end of the election. A clerk wishing to view the adjudication status of a ballot in any of these 46 batches would be unable to do

so, as no information about these batches exists in the new Adjudication database.

Thus, all 8,540 ballots processed before 2:58 PM on March 30, 2021, comprising over 49% of the total votes in the entire 2021 Grand Junction Municipal Election, cannot be verified and should not have been counted. These 8,540 ballots represent more than twice the winning margin in any of the four City Council races that occurred in this election.

III. Comparison of the November 2020 General Election Findings and the April 2021 Grand Junction Municipal Election Findings

Comparing the above findings for the two elections shows numerous similarities and also critical differences.

Similarities:
- In both elections, a software process running within the DVS system performed an unauthorized creation of new Adjudication and Tabulation databases.
- In both elections, database records of selected batches and of the ballots within those batches were copied into the new databases and were reprocessed.
- In both elections, selected batches were not copied to the new Adjudication and Tabulation databases, making adjudication information invisible to the Mesa County election clerks.

Differences:
- In the November 2020 General Election, records of a sequential series of batches and the ballots contained within them were copied from the original Adjudication and Tabulation databases to the new Adjudication and Tabulation databases, and the batches were copied in the same order as in the original databases. In the April 2021 Grand Junction Municipal Election, records of a non-sequential series of batches and the ballots contained within

them were copied, and they appear in the new Adjudication database in a different order than in the original database.

- In the April 2021 Grand Junction Municipal Election, the EMS User Logs (which show events and commands which were executed) show reference to a batch 89. As there were 88 batches in the original Adjudication database, this would have logically been the next batch received from the scanners. However, no record of a batch with the load order '89' exists in either Adjudication database, and there are missing load orders between 88 and 114 as well.

The similarities lead to the conclusion that the same method was used to alter the database records in both elections.

The differences lead to the conclusion that there is a degree of control in the method used to alter the database records which used parameters unique to each election.

IV. Summary Impact of Above Findings

This manipulation of batch and ballot records described above is significant for three reasons.

First, when the ballots were reprocessed as described above, including re-adjudication, it is logical to conclude that whatever votes had been initially recorded could well have been replaced by the reprocessed votes in the Main election database. The differences in the Manual Adjudication numbers certainly supports this possible conclusion. Thus, this procedure could change votes in the Main database without leaving any evidence to indicate changes had been made, or any way to determine the nature of the changes or what the original vote data was.

Second, the adjudication status (including the timestamps of adjudication events, the results of the adjudication, and the user who performed the

adjudication) of any ballots in the batches not copied to the new Adjudication database would not be viewable through the DVS client software applications.

Third, an examination of the EMS server which was less rigorous than ours would not likely have caught the fact that the Adjudication and Tabulation databases used at the end of the elections were not the same, nor did they contain the same records, as the databases used at the beginning of the elections. This leads to the possible conclusion that some batches and ballots were excluded from the new databases so as to inhibit the possibility of their being audited or examined.

V.   Lack of Referential Integrity in DVS Database Tables

Most modern database designs include a concept called "referential integrity." For example, if you have one table of data that has information about "people," and another table that has information about "colleges," you might have a field in an individual record in the "people's" table that can contain an id, or pointer, to the college he or she attended. Referential integrity, in this case, would mean that if "John Smith's" record had a pointer to the "University of Pittsburgh", the system should give an error if you try to remove the item "University of Pittsburgh" from the "colleges" table. It would not allow you to do this action because a field in "John Smith's" record refers to the college "University of Pittsburgh" and deleting that entry in the "colleges" table makes "John Smith's" record invalid.

However, some of the DVS Election Management System data structures have no such referential integrity built into them. Therefore, batch records in one database could be deleted without any consequence to records that point to that batch in another database, and without any detection of the error. This lack of referential integrity means that vote or ballot information could easily be added or removed from one part of the database without any warnings or errors occurring in other parts of the database.

It is, for example, possible to change the fields with vote counts in one table of the Main election database without having that change affect any other tables

or cause a referential integrity violation. This is a fundamental and critical breach of sound database design, particularly considering the importance of chain-of-custody and audit trail evidence for the provenance of ballot record and tabulated vote information in a voting system.

Please see Reference D for an example of how the batch and ballot data moves through the various databases and tables in the Dominion EMS.

VI.   Digital Ballot Images are Obfuscated and Unverifiable

An attempt was made to investigate the conditions of the digital ballot images to corroborate the findings above. This avenue of research is greatly hindered because the ballot IDs or sequence numbers in the batches are not relatable to their images, not even within the DVS databases themselves. This is an additional example of a lack of referential integrity within the system.

Additionally, the digital ballot images do not have the accompanying ".sha" files which are meant to prove the authenticity of the ballots. Therefore, any findings, including the integrity and authenticity of ballot images, related to the digital ballot images cannot be absolutely validated because there is no proof that the images are the ones created at the time the ballots were first processed.

Finally, code running within the EMS server that has the system access rights to create and alter SQL Server database records could be used to alter the stored digital ballot images themselves. The EMS Adjudication module software already has the capability of altering scanned images and legitimately does so for each manually adjudicated ballot.

DISCUSSION

The events described above show a significant manipulation of a large number of batch, ballot, and vote records in the DVS EMS Database in Mesa County, and there are only a few possible explanations for the manipulation.

1. Human Error

Extensive questioning of Mesa County election clerks has ruled out human error as the reason for the unauthorized creation of election databases on October 21, 2020, followed by reprocessing of 20,346 ballots. These personnel have a strong recollection of the events of October 21, 2020, and because of the timelines established both by their recollection and corresponding database time stamps, it is evident that any and all unusual actions they might have taken on that day were in response to the new database's creation having already occurred, and batch records being copied into the new database, which affected their ability to complete adjudication on some in-process ballots. Similarly, Mesa County election officials have a strong recollection of the events of March 30, 2021. They state that they did not take any steps that would have given rise to the unauthorized creation of new election databases during the 2021 Grand Junction Municipal Election on that day, followed by the reprocessing of 2,974 ballots,.

2. Software Failure

While an error or failure in the DVS EMS server is a possibility, it strains credulity that any error could cause the numerous specific events which are documented above. In particular, the non-sequential reloading of the batches during the 2021 Grand Junction Municipal Election, when compared with the sequential reloading in the November 2020 General Election, makes it inherently impossible for the same error to have caused both chains of events.

However, as noted in the section above labelled "Algorithmically Triggered", the DVS EMS server (or another connected machine running Dominion software) could have been preprogrammed to perform the unauthorized new database creations and the selected record manipulation which followed based on preprogrammed criteria related to the election results at the time. This would be the result of advance planning in the deliberate

design of the software to alter outcomes when unexpected voting patterns were detected.

3. **Network Breach or Pre-Installation of Manipulating Software or Algorithm**

A device external to the DVS D-Suite network could have connected to the DVS D-Suite and to the EMS server, using the open SQL Server port 1433, open Web Services port 80, or through any other open port directly into the DVS Software. As outlined in "Report #2, Forensic Examination and Analysis Report" by D. Gould, there are numerous flaws in the security of the server, many of which could provide an outside entity with direct access to the SQL Server Database or the Application itself. The DVS D-Suite makes use of "SOAP" messaging protocol API calls through its web server, so malicious procedures could be triggered by simple port 80 access.

As *all* Windows log files which would show these accesses are configured, as specified by DVS manuals published by the Colorado Secretary of State as mandatory technical procedures for County election officials, to keep only a small amount of log entries before they are overwritten, no record of external access to the DVS D-Suite is available in system logs.

Regardless of whether the voting system was connected to an external network or device, even momentarily, or whether a pre-installed software or algorithm was triggered by an external command or complex set of variable conditions, the execution of manipulating software or algorithm could plausibly be responsible for the results described in our findings.

CONCLUSIONS

1. Unauthorized creation of new Tabulation and Adjudication databases occurred during the counting of the November 2020 General Election, along with the selective copying of batch and ballot records from the original databases to the new ones. This manipulation places all 25,913 initial ballots counted into a state where they cannot be validated – some because

it is possible that their vote information was changed, and unverifiable that it was not, and the rest because their "chain of evidence" has been intentionally obfuscated. Even if the count and content of ballot images match the numbers and counts reported by the database, there is no method to validate those ballot images due to missing ".sha" files, which are intended to provide such validation.

2. Unauthorized creation of new Tabulation and Adjudication databases occurred during the 2021 Grand Junction Municipal Election, along with the selective copying of batch and ballot records from the original databases to the new ones. This places all 8,540 initial ballots counted into a state where they cannot be validated – some because it is possible that their vote information was changed and unverifiable that it was not, and some because their "chain of evidence" has been intentionally obfuscated.

3. As we have found evidence that thousands of ballot records have had their validity placed in serious question, none of the election results from the 2020 General or 2021 Grand Junction Municipal Elections in Mesa County can be considered trustworthy. If Mesa County has preserved the respective paper ballots, as they are required to do by law, and those ballots were forensically authenticated with confirmed chain-of-custody from eligible electors to sworn county election officials (not possible retrospectively, nor under current election procedures in Colorado), then a hand-count of paper ballots might support a verifiable, trustworthy conclusion about the county-level results of these two elections.

4. Because the unauthorized methods used to alter batch and ballot-level information described above are available within the DVS EMS server, this system cannot be considered reliable for use in any election. An investigation, involving all physical and cyber evidence, including a source code audit of the exact, verifiable version of all DVS-supplied executable and library files, is necessary to identify the exact software methods used to produce the manipulation and to determine other potential unauthorized actions that the code is able to cause or enable.

5. The Dominion Voting System's database structure stores actual vote information in only one table, in aggregated form, so alterations made to vote counts or candidates in just that table, create a single point of attack or failure for the entire vote reporting process (see Reference D).

APPENDIX A – BATCHES - ORIGINAL ADJUDICATION DATABASE (WITH TIME BETWEEN BATCHES) – NOVEMBER 2020 ELECTION

TabulatorId	BatchId	LoadOrder	Creation Date	Creation Time	Difference from Prior	Ballots

APPENDIX C – LOG ENTRIES FROM EMS USER LOG – OCTOBER 2020

Date and Time	Commands / Comments in red
10/21/2020 14:18:01	SubmitBatchCommand (execution duration: 1250ms): Batch 227 - Successfully synchronized results.
10/21/2020 14:18:02	SubmitBatchCommand (execution duration: 1156ms): Batch 226 - Successfully synchronized results.
10/21/2020 14:18:03	SubmitBatchCommand (execution duration: 1297ms): Batch 228 - Successfully synchronized results.
10/21/2020 14:18:05	SubmitBatchCommand (execution duration: 906ms): Batch 229 - Successfully synchronized results.
	The above four commands are the last 4 batches adjudicated before the database copy being written back to the database
10/21/2020 14:18:14	GetBatchesCommand (execution duration: 16ms): Cast vote record batch list was successfully retrieved (CvrSortOrder greater then 267).
10/21/2020 14:18:33	LoadResultsCommand (execution duration: 2688ms): Result file '1_1_7_3037_DETAIL.DVD' was loaded successfully.
	The above two statements are the Adjudication Module checking for new Batches, and then loading the DVD file from the NAS for the new one it encountered.
	Note that this batch never made it to the old Adjudication database, it eventually made it to the new one. We are at this point 18 seconds from the database copy.
10/21/2020 14:18:39	GetAdjudicationSupportStatusCommand (execution duration: 16ms): Adjudication status retrieved (Adjudication is enabled)
10/21/2020 14:18:52	GetAdjudicationSupportStatusCommand (execution duration: 0ms): Adjudication status retrieved (Adjudication is enabled)
	This is the only time that this command is seen in the log during the election period, and they happened 12 seconds BEFORE the copy and then again 1 second after.
10/21/2020 14:18:57	GetRelevantOutstackConditionsCommand (execution duration: 31ms): Successfully retrieved relevant outstack conditions
10/21/2020 14:19:26	GetRelevantOutstackConditionsCommand (execution duration: 0ms): Successfully retrieved relevant outstack conditions
	Again, the only time this command is seen, and to me it seems that it involves the new database trying to figure out the current adjudication status
10/21/2020 14:20:06	GetBatchesCommand (execution duration: 1156ms): Cast vote record batch list was successfully retrieved (CvrSortOrder greater then 0). Values of CvrSortOrder field for delivered batches are: 1
	This is the Adjudication Module looking for new batches on the NAS drive. As there are currently no batches (the new database was created with no records), it is looking for anything >0
10/21/2020 14:20:07	GetCastVoteRecordsCommand (execution duration: 219ms): Cast vote records for batch '1' successfully retrieved.
	1 Batch was found and retrieved
10/21/2020 14:20:25	GetBatchesCommand (execution duration: 47ms): Cast vote record batch list was successfully retrieved (CvrSortOrder greater then 1). Values of CvrSortOrder field for delivered batches are: 60, 61, 62, 63, 64, 65, 66, 67, 68, 69, 70, 71, 72, 73, 74, 75, 76, 77, 78, 79, 80, 81, 82, 83, 84, 85, 86, 87, 88, 89, 90, 91, 92, 93, 94, 95, 96, 97, 98, 99, 100, 101, 102, 103, 104, 105, 106, 107, 108, 109, 110, 111, 112, 113, 114, 115, 116, 117, 118, 119, 120, 121, 122, 123, 124, 125, 126, 127, 128, 129, 130, 131, 132, 133, 134, 135, 136, 137, 138, 139, 140, 141, 142, 143, 144, 145, 146, 147, 148, 149, 150, 151, 152, 153, 154, 155, 156, 157, 158, 159, 160, 161, 162, 163, 164, 165, 166, 167, 168, 169, 170, 171, 172, 173, 174, 175, 176, 177, 178, 179, 180, 181, 182, 183, 184, 185, 186, 187, 188, 189, 190, 191, 192, 193, 194, 195, 196, 197, 198, 199, 200, 201, 202, 203, 204, 205, 206, 207, 208, 209, 210, 211, 212, 213, 214, 215, 216, 217, 218, 219, 220, 221, 222, 223, 224, 225, 226, 227, 228, 229, 230, 231, 232, 233, 234, 235, 236, 237, 238, 239, 240, 241, 242, 243, 244, 245, 246, 247, 248, 249, 250, 251, 252, 253, 254, 255, 256, 257, 258, 259, 260, 261, 262, 263, 264, 265, 266, 267, 268
	Now the Adjudication module checks for new batches again. Note that the 1st time it found only one, now it finds ALL the rest from 60 - 267 (no sign of 2-59)
10/21/2020 14:20:26	GetCastVoteRecordsCommand (execution duration: 219ms): Cast vote records for batch '60' successfully retrieved.
10/21/2020 14:20:30	GetCastVoteRecordsCommand (execution duration: 312ms): Cast vote records for batch '61' successfully retrieved.

10/21/2020 14:20:34	GetCastVoteRecordsCommand (execution duration: 234ms): Cast vote records for batch '62' successfully retrieved.
10/21/2020 14:20:38	GetCastVoteRecordsCommand (execution duration: 250ms): Cast vote records for batch '63' successfully retrieved.
10/21/2020 14:20:43	GetCastVoteRecordsCommand (execution duration: 250ms): Cast vote records for batch '64' successfully retrieved.
10/21/2020 14:20:47	GetCastVoteRecordsCommand (execution duration: 344ms): Cast vote records for batch '65' successfully retrieved.
10/21/2020 14:20:51	GetCastVoteRecordsCommand (execution duration: 406ms): Cast vote records for batch '66' successfully retrieved.
10/21/2020 14:20:55	GetCastVoteRecordsCommand (execution duration: 250ms): Cast vote records for batch '67' successfully retrieved.
10/21/2020 14:20:59	GetCastVoteRecordsCommand (execution duration: 250ms): Cast vote records for batch '68' successfully retrieved.
10/21/2020 14:21:04	GetCastVoteRecordsCommand (execution duration: 250ms): Cast vote records for batch '69' successfully retrieved.
10/21/2020 14:21:08	GetCastVoteRecordsCommand (execution duration: 359ms): Cast vote records for batch '70' successfully retrieved.
10/21/2020 14:21:12	GetCastVoteRecordsCommand (execution duration: 250ms): Cast vote records for batch '71' successfully retrieved.
10/21/2020 14:21:16	GetCastVoteRecordsCommand (execution duration: 234ms): Cast vote records for batch '72' successfully retrieved.
10/21/2020 14:21:20	GetCastVoteRecordsCommand (execution duration: 297ms): Cast vote records for batch '73' successfully retrieved.
10/21/2020 14:21:24	GetCastVoteRecordsCommand (execution duration: 234ms): Cast vote records for batch '74' successfully retrieved.
10/21/2020 14:21:28	GetCastVoteRecordsCommand (execution duration: 344ms): Cast vote records for batch '75' successfully retrieved.
	The above log entries are the reloading of the batches 60 - 75
10/21/2020 14:21:29	GetCastVoteRecordImageCommand (execution duration: 0ms): Image for tabulator '10, batch '4001' and session '18' successfully retrieved.
	The Adjudication Module begins processing ballots needing adjudication (4001 = batch 1)
10/21/2020 14:21:33	GetCastVoteRecordsCommand (execution duration: 312ms): Cast vote records for batch '76' successfully retrieved.
10/21/2020 14:21:37	GetCastVoteRecordsCommand (execution duration: 234ms): Cast vote records for batch '77' successfully retrieved.

10/21/2020 14:32:14	GetCastVoteRecordsCommand (execution duration: 234ms): Cast vote records for batch '232' successfully retrieved.
10/21/2020 14:32:18	GetCastVoteRecordsCommand (execution duration: 234ms): Cast vote records for batch '233' successfully retrieved.

10/21/2020 14:32:23	GetCastVoteRecordsCommand (execution duration: 234ms): Cast vote records for batch '234' successfully retrieved.
10/21/2020 14:32:27	GetCastVoteRecordsCommand (execution duration: 250ms): Cast vote records for batch '235' successfully retrieved.
10/21/2020 14:32:31	GetCastVoteRecordsCommand (execution duration: 234ms): Cast vote records for batch '236' successfully retrieved.
10/21/2020 14:32:36	GetCastVoteRecordsCommand (execution duration: 234ms): Cast vote records for batch '237' successfully retrieved.
10/21/2020 14:32:40	GetCastVoteRecordsCommand (execution duration: 250ms): Cast vote records for batch '238' successfully retrieved.
10/21/2020 14:32:44	GetCastVoteRecordsCommand (execution duration: 234ms): Cast vote records for batch '239' successfully retrieved.
10/21/2020 14:32:48	GetCastVoteRecordsCommand (execution duration: 266ms): Cast vote records for batch '240' successfully retrieved.
10/21/2020 14:32:52	GetCastVoteRecordsCommand (execution duration: 219ms): Cast vote records for batch '241' successfully retrieved.
10/21/2020 14:32:57	GetCastVoteRecordsCommand (execution duration: 313ms): Cast vote records for batch '242' successfully retrieved.
10/21/2020 14:33:01	GetCastVoteRecordsCommand (execution duration: 234ms): Cast vote records for batch '243' successfully retrieved.
10/21/2020 14:33:06	GetCastVoteRecordsCommand (execution duration: 234ms): Cast vote records for batch '244' successfully retrieved.
10/21/2020 14:33:10	GetCastVoteRecordsCommand (execution duration: 297ms): Cast vote records for batch '245' successfully retrieved.
10/21/2020 14:33:14	GetCastVoteRecordsCommand (execution duration: 234ms): Cast vote records for batch '246' successfully retrieved.
10/21/2020 14:33:18	GetCastVoteRecordsCommand (execution duration: 219ms): Cast vote records for batch '247' successfully retrieved.
10/21/2020 14:33:22	GetCastVoteRecordsCommand (execution duration: 234ms): Cast vote records for batch '248' successfully retrieved.
10/21/2020 14:33:26	GetCastVoteRecordsCommand (execution duration: 344ms): Cast vote records for batch '249' successfully retrieved.
10/21/2020 14:33:31	GetCastVoteRecordsCommand (execution duration: 234ms): Cast vote records for batch '250' successfully retrieved.
10/21/2020 14:33:34	GetCastVoteRecordsCommand (execution duration: 219ms): Cast vote records for batch '251' successfully retrieved.
10/21/2020 14:33:38	GetCastVoteRecordsCommand (execution duration: 234ms): Cast vote records for batch '252' successfully retrieved.
10/21/2020 14:33:43	GetCastVoteRecordsCommand (execution duration: 234ms): Cast vote records for batch '253' successfully retrieved.
10/21/2020 14:33:47	GetCastVoteRecordsCommand (execution duration: 234ms): Cast vote records for batch '254' successfully retrieved.
10/21/2020 14:33:51	GetCastVoteRecordsCommand (execution duration: 281ms): Cast vote records for batch '255' successfully retrieved.
10/21/2020 14:33:55	GetCastVoteRecordsCommand (execution duration: 234ms): Cast vote records for batch '256' successfully retrieved.
10/21/2020 14:33:59	GetCastVoteRecordsCommand (execution duration: 234ms): Cast vote records for batch '257' successfully retrieved.
10/21/2020 14:34:03	GetCastVoteRecordsCommand (execution duration: 141ms): Cast vote records for batch '258' successfully retrieved.
10/21/2020 14:34:05	GetCastVoteRecordsCommand (execution duration: 234ms): Cast vote records for batch '259' successfully retrieved.
10/21/2020 14:34:10	GetCastVoteRecordsCommand (execution duration: 344ms): Cast vote records for batch '260' successfully retrieved.
10/21/2020 14:34:13	GetCastVoteRecordsCommand (execution duration: 234ms): Cast vote records for batch '261' successfully retrieved.
10/21/2020 14:34:17	GetCastVoteRecordsCommand (execution duration: 234ms): Cast vote records for batch '262' successfully retrieved.

10/21/2020 14:34:21	GetCastVoteRecordsCommand (execution duration: 234ms): Cast vote records for batch '263' successfully retrieved.
10/21/2020 14:34:25	GetCastVoteRecordsCommand (execution duration: 234ms): Cast vote records for batch '264' successfully retrieved.
10/21/2020 14:34:30	GetCastVoteRecordsCommand (execution duration: 234ms): Cast vote records for batch '265' successfully retrieved.
	The reload is almost complete
10/21/2020 14:34:33	GetCastVoteRecordImageCommand (execution duration: 16ms): Image for tabulator '10, batch '4001' and session '25' successfully retrieved.
	A second ballot from batch 1 goes to adjudication
10/21/2020 14:34:34	GetCastVoteRecordsCommand (execution duration: 234ms): Cast vote records for batch '266' successfully retrieved.
10/21/2020 14:34:38	GetCastVoteRecordsCommand (execution duration: 234ms): Cast vote records for batch '267' successfully retrieved.
	At this point we have reloaded all of the batches from the original database. Time elapsed since copy event: 11 minutes, 47 seconds
	This is 3 seconds (on average) per copied batch, .03 seconds (on average) per ballot.
10/21/2020 14:34:42	GetCastVoteRecordsCommand (execution duration: 234ms): Cast vote records for batch '268' successfully retrieved.
	This is the system actually loading up batch 3037, the last one that was saved before the database copy. (See line 7 above)
	At this point all but 58 batches and their ballots from the original Adjudication database are now copied to the new database

APPENDIX D – LOG ENTRIES FROM EMS USER LOG – MARCH 2021

Date and Time	Command / Comment
03/30/2021 14:57:16	GetCastVoteRecordImageCommand (execution duration: 16ms): Image for tabulator '30, batch '3044' and session '72' successfully retrieved.
	Adjudication Module requesting an image so that it can be adjudicated
03/30/2021 14:57:17	GetBatchesCommand (execution duration: 0ms): Cast vote record batch list was successfully retrieved (CvrSortOrder greater then 88).
03/30/2021 14:57:32	GetBatchesCommand (execution duration: 16ms): Cast vote record batch list was successfully retrieved (CvrSortOrder greater then 88).
03/30/2021 14:57:47	GetBatchesCommand (execution duration: 16ms): Cast vote record batch list was successfully retrieved (CvrSortOrder greater then 88).
03/30/2021 14:58:02	GetBatchesCommand (execution duration: 0ms): Cast vote record batch list was successfully retrieved (CvrSortOrder greater then 88).
	Normal checks for new batches. We are 54 seconds from database copy event
03/30/2021 14:58:41	GetAdjudicationSupportStatusCommand (execution duration: 16ms): Adjudication status retrieved (Adjudication is enabled)
03/30/2021 14:58:57	GetAdjudicationSupportStatusCommand (execution duration: 16ms): Adjudication status retrieved (Adjudication is enabled)
	Like in the November 2020 election these two commands appear right before and right after the copy event.
03/30/2021 14:58:59	GetRelevantOutstackConditionsCommand (execution duration: 47ms): Successfully retrieved relevant outstack conditions
03/30/2021 14:59:15	GetRelevantOutstackConditionsCommand (execution duration: 0ms): Successfully retrieved relevant outstack conditions
	These two commands also were found just after the database copy event
03/30/2021 14:59:52	GetBatchesCommand (execution duration: 156ms): Cast vote record batch list was successfully retrieved (CvrSortOrder greater then 0). Values of CvrSortOrder field for delivered batches are: 45, 46
03/30/2021 14:59:52	GetCastVoteRecordsCommand (execution duration: 406ms): Cast vote records for batch '46' successfully retrieved.
03/30/2021 14:59:56	GetCastVoteRecordsCommand (execution duration: 109ms): Cast vote records for batch '47' successfully retrieved.
	The select batches from the original Adjudication database begin being encountered, although like November 2020, not all at once.
03/30/2021 15:00:14	GetBatchesCommand (execution duration: 16ms): Cast vote record batch list was successfully retrieved (CvrSortOrder greater then 46). Values of CvrSortOrder field for delivered batches are: 48, 49
03/30/2021 15:00:14	GetCastVoteRecordsCommand (execution duration: 78ms): Cast vote records for batch '49' successfully retrieved.
03/30/2021 15:00:18	GetCastVoteRecordsCommand (execution duration: 109ms): Cast vote records for batch '50' successfully retrieved.

03/30/2021 15:00:36	GetBatchesCommand (execution duration: 31ms): Cast vote record batch list was successfully retrieved (CvrSortOrder greater then 49). Values of CvrSortOrder field for delivered batches are: 51, 52, 53, 54, 55, 56, 57, 58, 59, 60, 61, 62, 63, 64, 65, 66, 67, 68, 69, 70, 71, 72, 73, 74, 75, 76, 77, 78, 79, 80, 81, 82, 83, 84, 85, 86, 87, 88
03/30/2021 15:00:36	GetCastVoteRecordsCommand (execution duration: 94ms): Cast vote records for batch '52' successfully retrieved.
03/30/2021 15:00:40	GetCastVoteRecordsCommand (execution duration: 78ms): Cast vote records for batch '53' successfully retrieved.
03/30/2021 15:00:43	GetCastVoteRecordsCommand (execution duration: 94ms): Cast vote records for batch '54' successfully retrieved.
03/30/2021 15:00:47	GetCastVoteRecordsCommand (execution duration: 78ms): Cast vote records for batch '55' successfully retrieved.
03/30/2021 15:00:51	GetCastVoteRecordsCommand (execution duration: 78ms): Cast vote records for batch '56' successfully retrieved.
03/30/2021 15:00:54	GetCastVoteRecordsCommand (execution duration: 94ms): Cast vote records for batch '57' successfully retrieved.
03/30/2021 15:00:58	GetCastVoteRecordsCommand (execution duration: 78ms): Cast vote records for batch '58' successfully retrieved.
03/30/2021 15:01:01	GetCastVoteRecordsCommand (execution duration: 125ms): Cast vote records for batch '59' successfully retrieved.
03/30/2021 15:01:05	GetCastVoteRecordsCommand (execution duration: 78ms): Cast vote records for batch '60' successfully retrieved.
03/30/2021 15:01:08	GetCastVoteRecordsCommand (execution duration: 94ms): Cast vote records for batch '61' successfully retrieved.
03/30/2021 15:01:11	GetCastVoteRecordsCommand (execution duration: 94ms): Cast vote records for batch '62' successfully retrieved.
03/30/2021 15:01:15	GetCastVoteRecordsCommand (execution duration: 94ms): Cast vote records for batch '63' successfully retrieved.
03/30/2021 15:01:19	GetCastVoteRecordsCommand (execution duration: 125ms): Cast vote records for batch '64' successfully retrieved.
03/30/2021 15:01:22	GetCastVoteRecordsCommand (execution duration: 78ms): Cast vote records for batch '65' successfully retrieved.
03/30/2021 15:01:25	GetCastVoteRecordsCommand (execution duration: 78ms): Cast vote records for batch '66' successfully retrieved.
03/30/2021 15:01:29	GetCastVoteRecordsCommand (execution duration: 94ms): Cast vote records for batch '67' successfully retrieved.
03/30/2021 15:01:33	GetCastVoteRecordsCommand (execution duration: 94ms): Cast vote records for batch '68' successfully retrieved.
03/30/2021 15:01:36	GetCastVoteRecordsCommand (execution duration: 94ms): Cast vote records for batch '69' successfully retrieved.
03/30/2021 15:01:40	GetCastVoteRecordsCommand (execution duration: 94ms): Cast vote records for batch '70' successfully retrieved.

03/30/2021 15:01:44	GetCastVoteRecordsCommand (execution duration: 109ms): Cast vote records for batch '71' successfully retrieved.
03/30/2021 15:01:48	GetCastVoteRecordsCommand (execution duration: 94ms): Cast vote records for batch '72' successfully retrieved.
03/30/2021 15:01:51	GetCastVoteRecordsCommand (execution duration: 94ms): Cast vote records for batch '73' successfully retrieved.
03/30/2021 15:01:55	GetCastVoteRecordsCommand (execution duration: 78ms): Cast vote records for batch '74' successfully retrieved.
03/30/2021 15:01:59	GetCastVoteRecordsCommand (execution duration: 109ms): Cast vote records for batch '75' successfully retrieved.
03/30/2021 15:02:02	GetCastVoteRecordsCommand (execution duration: 109ms): Cast vote records for batch '76' successfully retrieved.
03/30/2021 15:02:06	GetCastVoteRecordsCommand (execution duration: 94ms): Cast vote records for batch '77' successfully retrieved.
03/30/2021 15:02:09	GetCastVoteRecordsCommand (execution duration: 78ms): Cast vote records for batch '78' successfully retrieved.
03/30/2021 15:02:12	GetCastVoteRecordsCommand (execution duration: 78ms): Cast vote records for batch '79' successfully retrieved.
03/30/2021 15:02:16	GetCastVoteRecordsCommand (execution duration: 63ms): Cast vote records for batch '80' successfully retrieved.
03/30/2021 15:02:19	GetCastVoteRecordsCommand (execution duration: 109ms): Cast vote records for batch '81' successfully retrieved.
03/30/2021 15:02:22	GetCastVoteRecordsCommand (execution duration: 94ms): Cast vote records for batch '82' successfully retrieved.
03/30/2021 15:02:26	GetCastVoteRecordsCommand (execution duration: 94ms): Cast vote records for batch '83' successfully retrieved.
03/30/2021 15:02:29	GetCastVoteRecordsCommand (execution duration: 78ms): Cast vote records for batch '84' successfully retrieved.
03/30/2021 15:02:33	GetCastVoteRecordsCommand (execution duration: 109ms): Cast vote records for batch '85' successfully retrieved.
03/30/2021 15:02:37	GetCastVoteRecordsCommand (execution duration: 78ms): Cast vote records for batch '86' successfully retrieved.
03/30/2021 15:02:40	GetCastVoteRecordsCommand (execution duration: 94ms): Cast vote records for batch '87' successfully retrieved.
03/30/2021 15:02:44	GetCastVoteRecordsCommand (execution duration: 94ms): Cast vote records for batch '88' successfully retrieved.
03/30/2021 15:02:47	GetCastVoteRecordsCommand (execution duration: 47ms): Cast vote records for batch '89' successfully retrieved.
03/30/2021 15:03:04	GetBatchesCommand (execution duration: 16ms): Cast vote record batch list was successfully retrieved (CvrSortOrder greater then 88).

03/30/2021 15:03:19	SubmitBatchCommand (execution duration: 203ms): Batch 63 - Successfully synchronized results.
03/30/2021 15:03:19	GetBatchesCommand (execution duration: 16ms): Cast vote record batch list was successfully retrieved (CvrSortOrder greater then 88).
03/30/2021 15:03:19	SubmitBatchCommand (execution duration: 141ms): Batch 59 - Successfully synchronized results.
03/30/2021 15:03:20	SubmitBatchCommand (execution duration: 125ms): Batch 61 - Successfully synchronized results.
03/30/2021 15:03:20	SubmitBatchCommand (execution duration: 78ms): Batch 62 - Successfully synchronized results.
03/30/2021 15:03:20	SubmitBatchCommand (execution duration: 78ms): Batch 64 - Successfully synchronized results.
03/30/2021 15:03:20	SubmitBatchCommand (execution duration: 62ms): Batch 65 - Successfully synchronized results.
03/30/2021 15:03:21	SubmitBatchCommand (execution duration: 109ms): Batch 67 - Successfully synchronized results.
03/30/2021 15:03:21	SubmitBatchCommand (execution duration: 78ms): Batch 68 - Successfully synchronized results.
03/30/2021 15:03:21	SubmitBatchCommand (execution duration: 62ms): Batch 69 - Successfully synchronized results.
03/30/2021 15:03:21	SubmitBatchCommand (execution duration: 94ms): Batch 70 - Successfully synchronized results.
03/30/2021 15:03:21	SubmitBatchCommand (execution duration: 62ms): Batch 71 - Successfully synchronized results.
03/30/2021 15:03:22	SubmitBatchCommand (execution duration: 63ms): Batch 72 - Successfully synchronized results.
03/30/2021 15:03:22	SubmitBatchCommand (execution duration: 62ms): Batch 74 - Successfully synchronized results.
03/30/2021 15:03:22	SubmitBatchCommand (execution duration: 78ms): Batch 56 - Successfully synchronized results.
03/30/2021 15:03:34	GetBatchesCommand (execution duration: 0ms): Cast vote record batch list was successfully retrieved (CvrSortOrder greater then 88).
03/30/2021 15:03:40	SubmitBatchCommand (execution duration: 188ms): Batch 75 - Successfully synchronized results.
03/30/2021 15:03:48	SubmitBatchCommand (execution duration: 172ms): Batch 79 - Successfully synchronized results.
03/30/2021 15:03:48	SubmitBatchCommand (execution duration: 125ms): Batch 77 - Successfully synchronized results.
03/30/2021 15:03:48	SubmitBatchCommand (execution duration: 109ms): Batch 78 - Successfully synchronized results.

03/30/2021 15:03:49	GetBatchesCommand (execution duration: 0ms): Cast vote record batch list was successfully retrieved (CvrSortOrder greater then 88).
03/30/2021 15:03:51	SubmitBatchCommand (execution duration: 125ms): Batch 80 - Successfully synchronized results.
03/30/2021 15:04:04	GetBatchesCommand (execution duration: 16ms): Cast vote record batch list was successfully retrieved (CvrSortOrder greater then 88).
03/30/2021 15:04:14	SubmitBatchCommand (execution duration: 203ms): Batch 82 - Successfully synchronized results.
03/30/2021 15:04:18	SubmitBatchCommand (execution duration: 156ms): Batch 84 - Successfully synchronized results.
03/30/2021 15:04:19	SubmitBatchCommand (execution duration: 125ms): Batch 83 - Successfully synchronized results.
03/30/2021 15:04:19	GetBatchesCommand (execution duration: 0ms): Cast vote record batch list was successfully retrieved (CvrSortOrder greater then 88).
03/30/2021 15:04:21	SubmitBatchCommand (execution duration: 156ms): Batch 85 - Successfully synchronized results.
03/30/2021 15:04:34	GetBatchesCommand (execution duration: 16ms): Cast vote record batch list was successfully retrieved (CvrSortOrder greater then 88).
03/30/2021 15:04:48	SubmitBatchCommand (execution duration: 109ms): Batch 89 - Successfully synchronized results.
03/30/2021 15:04:49	SubmitBatchCommand (execution duration: 141ms): Batch 87 - Successfully synchronized results.
03/30/2021 15:04:49	SubmitBatchCommand (execution duration: 156ms): Batch 88 - Successfully synchronized results.
	Like November 2020, the rest of the batches from the original Adjudication database are copied and reprocessed.
	The order, however, is not the same, and there is a referenced to a batch 89 which does not have a record in either Adjudication database.

REFERENCE A – DATABASES AND TABLES

In order to assist other researchers, who may wish to examine these findings or perform additional analysis, here are the most important databases and tables which were used in this analysis.

Main election databases:

November 2020 General Election:
[2020 Mesa County General-2020-09-05-00-10-20]

April 2021 Municipal Election:
[City of Grand Junction-Municipal Election 2021-2021-02-05-16-01-32]

Primary Tables (specifically related to vote totals):
ResultContainer: (Batch level raw vote data)
ResultSplitter: (Vote Data by Polling Location
ChoiceResult: (Raw aggregated vote data)
CastVoteRecord: (Raw per-ballot list)
Choice: (All Candidates/Choices)
Contest: (All contests in Election)
Tabulator: (All defined tabulators)

Stored Procedures (useful for checking final results):
GetContestResults: Displays current results of any or all contests
GetContestStatistics: Displays stats for any or all contests, including undervotes and overvotes

Adjudication databases:

November 2020 General Election:
[AdjudicableBallotStore_2020_Mesa_County_General_2020-10-01_12:18:50] (before copy)
[AdjudicableBallotStore_2020_Mesa_County_General_2020-10-21_14:18:51] (after copy)

April 2021 Municipal Election:
[AdjudicableBallotStore_City_Of_Grand_Junction_Municipal_Election_2021_2021-03-18_10:48:14] (before copy)

[AdjudicableBallotStore_City_Of_Grand_Junction_Municipal_Election_2021_2021-03-30_14:58:56] (after copy)

Primary Tables:
Batches: Raw batch information
SerializedAdjudicableBallots: Contains one data record for each ballot received.
BallotStatusEvents: Every ballot with Adjudication status. New records for same ballot whenever any change occurs in the status of the ballot.

REFERENCE B – SCANNER SPEED

4.5 Processing Rate

The central scanning device's processing rate also depends on the handling and poll verification activities.

The number of ballots per minute depends on the width or length of the ballot. The following table documents the approximate scanning speed of the ICC scanners.

Scanner	Ballot Size	Pages per Minute (ppm) Scanned
Canon DR-G1130	8.5" x 11"	Approximately 100 ppm, as per Dominion Voting's Quality Assurance test results.
Canon DR-G2140	8.5" x 22"	Aproximately 70 ppm, as per Dominion Voting's Quality Assurance test results.
Canon DR-M160II	8.5" x 11"	Approximately 60 ppm, as per Dominion Voting's Quality Assurance test results.

https://www.sos.state.co.us/pubs/elections/VotingSystems/DVS-DemocracySuite511/documentation/2-03-ICC-FunctionalityDescription-5-11-CO.pdf

REFERENCE C – SCANNERS USED BY MESA COUNTY

DESCRIPTION	QTY	UNIT PRICE	EXTENSION
Central Scanning Hardware & Software License			
ImageCast Central Includes:	4	$18,500	$74,000
Canon DR-G1130 high speed document scanner.			
- ImageCast® Central Software including third party Kofax VRS 4.5 software.			
- OptiPlex 9020 All-in-One Series with pre-loaded software			
- One (1) iButton Programmer and (1) iButton Key Switch & Cat5 RJ 45			
Cables			
- 12 months Hardware Warranty			
- 12 months Firmware License			

https://onbase.mesacounty.us/OnBaseAgendaOnline/Documents/Downloadfile/Special_Meeting_1018_Agenda_Packet_8_24_2021_1_00_00_PM.pdf?documentType=5&meetingId=1018&isAttachment=True

REFERENCE D – DATA MOVEMENT FROM BATCHES TO VOTES

Below please find an example of how the data moves through the system from the batch to its votes, and how the ballot level vote data is obfuscated in the process. Blank and irrelevant fields are omitted.

When batch 4025 was received in the Mesa County November 2020 election, the following record was created in the *batches* table of the Adjudication database.

Field	Value
TabulatorId	10
BatchId	4025
Name	Tabulator 10 - Batch 4025
LoadOrder	60
CreationTime	10/21/20 2:20 PM
ModificationTime	10/22/20 10:33 AM
BallotCount	99
HasAdjudicatedBallots	1

After all adjudication tasks were complete, a record exists in the Main election database *ResultContainer* table.

Field	Value
Id	60
containerType	CVR
resultState	Published
batchId	4025
fileName	1_1_10_4025_DETAIL.DVD
tabulatorId	10
CvrSortOrder	60
TimeStamp	10/19/20 4:12 PM

This table serves as a record of each individual batch received, and the *batchId* field (4025 in this case) references the *BatchId* of the Adjudication database's *Batches* table, as shown above. This is the first evidence of a break in referential integrity, as there is no database-level relationship between these two tables. In

other words, the *Batches* record in the Adjudication database can be removed or altered without any warning or error being generated by the database.

Of note also is that the number of ballots which exists in each batch is not a part of the *ResultContainer* table. This makes reconciling the data in the Main election database tables much more difficult.

From here, the information goes to three other tables of interest in the Main election database. The first is *CastVoteRecord*, which contains the ballot-level vote data.

Id	ResultContainerId	RecordId	PrecinctPortionId	IsCurrent	OriginalCvrId	OutstackConditions	BallotTypeId	tabulatorId	batchId

Page **80** of **87**

There is one record for each ballot in batch 4025, and then an additional record for each ballot which went through the manual adjudication process. The *IsCurrent* field indicates which of the two ballot records is the latest one. No timestamp exists in this table to be able to determine the time the ballot data was entered or modified.

Unlike a "Cast Vote Record" file, this table contains no vote information.

Next is *ResultSplitter*. Batch 4025 was separated into 42 rows in this table:

Id	numberOfValid	pollingDistrictId	resultContainerId	numberOfWriteIns	tabulatorId	ballotId
2008	1	30	60	0	10	1
2007	2	104	60	0	10	7
2006	1	35	60	0	10	1

1972	3	63	60	0	10	7
1971	4	111	60	0	10	7
1970	2	44	60	0	10	3
1969	1	66	60	0	10	8
1968	2	103	60	0	10	7
1967	2	124	60	0	10	5

The 99 ballots in batch 4025 are segregated here by polling district number. No vote information appears in this table, and this table links back to its corresponding record in the *ResultContainer* table through the *resultContainerId* field. Again, this table contains no specific vote information for the ballots.

Next is the table *ChoiceResult*. Because of how the records are aggregated, there are over 1,600 records for batch 4025. For brevity, only the first 49 records are displayed.

Id	numberOfVotes	isValid	contestResultId	pollingDistrictId	tabulatorId	resultContainerId	choiceId	partyId

72120	1	1	56740	63	10	60	57	0
72119	2	1	56740	63	10	60	56	0

This table, the only table which actually has a record of the vote totals used to produce reports, aggregates the votes by polling district and candidate or issue choice. As an example, the fifth line of data specifies that there are two votes for Donald Trump (*choiceId* 2, which references the *internalMachineId field* of the table *Choice*) from polling district 3075539035 – GJ (*pollingDistrictId* 79, which references the *internalMachineId* field of the table *PollingDistrict*).

From this table, and the associated tables it links to, all reports are generated. As this is the only table which records vote choices, this is a single point of attack

or failure for the entire vote counting process of the Dominion system. Changes can be made to this table by any process, for instance changing the number of votes or the candidate, would be undetectable as such changes do not affect any other records in any other tables. Nor would such changes require alterations of any other records in any other tables.

Additionally, there is no way to consistently link a particular vote shown in the *ChoiceResult* table to its original ballot within the batch.

The foregoing Forensic Examination and Report was prepared by us, and we are responsible for its content.

BIOGRAPHY

Jeffrey O'Donnell is a Full Stack software and database developer and analyst. He holds Bachelor's degrees in Computer Science and Mathematics from the University of Pittsburgh.

Over the last 40 years, Mr. O'Donnell has worked and consulted for numerous private sector corporations, including Rockwell International, Westinghouse Electric Nuclear, General Defense, U.S. Steel, Mellon Bank, IOTA 360, and the Penn State Applied Research Laboratory. For several years he also delivered and created computer science curriculum for the Community College of Allegheny County.

For the last two decades, Mr. O'Donnell has developed numerous "big data" analysis systems, including systems to provide short-term stock market investors with new types of research and predictive analytics.

He currently is President of Qest Development, a full-service software consulting and publishing company, and is Chief Information Officer of Ordros Analytics, which specializes in election analytics of all types.

Dr. Walter C. Daugherity is a computer consultant and also Senior Lecturer Emeritus in the Department of Computer Science and Engineering at Texas A&M University. He graduated from Oklahoma Christian University with a degree in mathematics, and then earned master's and doctor's degrees from Harvard University, which he attended on a Prize Fellowship from the National Science Foundation.

As a computer expert he has consulted for major national and international firms, and for government agencies. He helped develop the national computer keyboard standard and invented integrated user training within computer applications as well as various electronic computer interfaces.

As a computer science and engineering teacher and researcher, he has published 26 research articles from over $2.8 million in funded research projects, plus conference papers and other publications. He taught many areas of computer science and engineering for 37 years (32 years at Texas A&M University), including artificial intelligence, quantum computing, programming and software design, and cyber-ethics.

At Harvard he received the Bowdoin Prize and medal for writing, and in 2015 was named a Distinguished Alumnus of Oklahoma Christian University. He is a life member of the Association for Computing Machinery and American MENSA.

COMMENTS ON APRIL 15, 2022
PROPOSED RULES
8 CCR 1505-1 et al
Submitted by Jeffrey O'Donnell
May 23, 2022

GENERAL COMMENTS

In general, I submit my agreement with the states made by Maurice Emmer in his comments on the Proposed rules. My additional comments and opinions are based upon my in-depth research into the previous elections in Colorado, but many other U.S. States.

I am an author and principal investigator of the Mesa County Report #3, which determined through exhaustive research and testing of the Dominion Voting Systems data contained on the Election Server's hard drive image that code within the Dominion software performed unauthorized and illegal manipulations of digital records, causing over 25% of all that county's ballots cast in the November 3 2020 general election to be untrustworthy (and also nearly half of the ballots cast in their April 3 2021 Municipal election). The evidence in this report, which has also been submitted, makes it clear that unless and until the issues found are identified and verifiably removed, Dominion Voting Systems software should not be used to run any election.

USE OF ELECTION MACHINES SHOULD BE VOLUNTARY

If the State of Colorado is determined to allow computerized Election Management Systems to be used in the state, that each county should be given the right to opt-out of their use and may instead use a state-approved hand-counted paper ballot system using high-security features on the ballots (similar to U.S. Currency or security checks used by banks) and that these ballots be individually numbered and publicly accounted for. There have been numerous organizations who have worked to provide a blueprint for running an election without election computers that are scalable to counties of any size and are lower in cost than the current machine solutions.

ELECTION RECORDS MUST BE TRANSPARENT

The Colorado laws which place roadblocks in the way of public access to election records must be stricken and replaced with new laws which are in the traditional spirit of "sunshine laws". Any type of record which does not easily identify the vote cast by an individual voter should be open to public request. Examples of this type of data are:

1. Records and statements of votes and ballots cast (which include "Statements of Votes Cast", "Cast Vote Records", "Batch Vote Results", and others). None of these reports has any information which would endanger voter secrecy. In rare cases where all voters in a small precinct voted the same way, records from those precincts may be redacted.

2. Tabulator log files

3. Ballot images. These images do not identify a voter unless the voter has, for some reason, decided to write something extra on the ballot which identifies them. In this exceedingly rare case, it should be adjudged that the voter has voluntarily exempted themselves from voter secrecy.

4. Voter Rolls/Voter History/Purged Voter Lists. The state election apparatus should be compelled to create and publish monthly files listing voters contained on its rolls, and the history of the elections in which that voter has participated. Florida is a state which makes these files available on a subscription basis. They should also publish a monthly report listing all voters inactivated or removed from the rolls during that month.

5. Any available video of any location having anything to do with accepting or counting ballots.

6. Any available video of drop box locations (24-hour video of these drop-boxes during the entire election period should be rigorously maintained and verified).

The public availability of these records would have the immediate effect of discouraging fraud and allowing simple detection of any fraud. It would also go a long way towards restoring public confidence in our elections.

CHANGES TO RECORDS RETENTION LAWS

The current definition of "election records" in Colorado statutes is exceedingly narrow, and it does not specifically include digital records and conflicts with Federal law. Colorado should lead the way by defining election records as "all records pertaining to an election or necessary to audit or recount that election, both on paper or stored electronically". Every file on every computer system used in the election should be included in this definition.

In addition, a clause should be added to the law providing the same retention statutes and penalties to any vendor from whom equipment or software is purchased or licensed.

CHANGES TO ELECTION CRIME PENALTIES

Any violation of any part of election law, including non-permitted destruction of records or alteration/destruction of records, should be elevated to a felony. Any third-party vendor proved to have committed an election-related crime of any kind should be barred from doing business in the state.

ELECTION MANAGEMENT SYSTEM SOFTWARE MUST BE ESCROWED

Any company whose software is used in any part of Colorado's elections should place a complete, verifiable copy of their source code into escrow with a trusted entity. The state must reserve the right to examine that source code at any time should they need to investigate (under strict non-disclosure of legitimate trade secrets) evidence of an election-related crime.

SIGNATURE VERIFICATION OF ABSENTEE BALLOTS MUST BE ABSOLUTE

It is my opinion, based upon the evidence I have seen across the country, that universal absentee voting creates too many avenues for fraud, and should be abolished, allowing absentee voting only for the verifiably infirm, traveling, or deployed military.

If Colorado choose to continue this risky process, signature verification of absentee ballots must be a top priority, and these signatures should be inspected by election officials as opposed to computer scanning software. There is an attitude towards the verification of the legitimacy of absentee ballots that makes the process lenient. In my opinion, it should be extremely strict – instead of looking for ways to approve a ballot, we should be looking critically for reasons to reject it. This opinion is based upon my own experiences as well as recent reports from the True the Vote organization, which has documented the use of "ballot mules" to distribute highly suspect absentee ballots between drop-boxes.

It is my fervent hope that these recommendations are considered seriously and will be adopted into Colorado law.

Best regards,

Jeffrey O'Donnell

Jeffrey O'Donnell

Comments for 5/24 rule hearing

1.1.29

"This does not include a full or partial hard drive image or clone."

This is problematic as it excludes the ability of the Clerk to retain the Server Log File. The Server log file contains record of any external or internal connection to the internet.

In order for a County Clerk to Comply with 2.5.3 (A) (1) " The County Clerk must ensure that the wireless capability or device is disabled before use in an election," he must be able to access and review the Server Log file for intrusion.

The Server Log file has three relevant fields. 1) a time and date stamp 2) IP addresses of any connected devices 3) a function field. Every Clerk must know the IP addresses of all legitimate connected devices and it doesn't take an IT specialist to read these three files. Any IP addresses other than legitimate local addresses that are present on the Server Log File are valid reason for a Clerk to not certify an election.

An SOS should not be legally allowed to override a Clerk failure to certify an election for this reason.

Currently the Server Log File may be hidden from the Clerk by an SOS password. Access to this file by the Clerk must be freely accessible.

As a CPA, I identify five should be required audit points of which Colorado only does two.

1) Audit of the voter registration file for authenticity. This may be done on a random sample basis. This is not currently being done.
2) Logic and Accuracy Test validates pre-election scoring of test ballots. Currently being done.
3) Risk Limiting Audit validates random sample of original ballots to ballot scoring. Currently being done.
4) Forensic or truthfulness audit validates on a random sample basis, that ballots are legitimate ballots supplied to voter considering water marks, pen indentation etc. Currently not being done.
5) **100% review of Server Log File IP addresses to ensure that no intrusion has occurred. Currently not being done.**
6) Post-election audit of totaling process on a random sample basis. Similar to LAT but post-election. Not currently being done.

Of audit steps not currently being done, review of the Serer log file is the most critical.

2006.3 Security at Trusted Build

Because the Server Log file contains critical election data and must be subject to 22 months Federal and 25 months data retention statutes, the contents and access to the Server Log File must not be destroyed during trusted build. No mention of this is currently made allowing for trusted build to potentially cover system or operational flaws by Vendor, Clerk or SOS.

SCORE Rule Change Objections
## May 24th, 2022 Hearing

Statement by Jeff Young

The Secretary of State's office has failed to abide by its voter list maintenance obligations under Section 8 of the National Voter Registration Act of 1993 ("NVRA" or "Act"), 52 U.S.C. § 20507 (in addition to C.R.S. 1-1-107(1)(d)-(e)) and currently has an ongoing lawsuit filed by Judicial Watch and three residents of Colorado claiming such (**Judicial Watch et al V Jena Griswold**). In fact, 11% or 459,678 voters on the rolls as of May 2022 are inactive. As seen in *Exhibit 1* below, from the top 10 counties in Colorado by population (El Paso, Denver, Arapahoe, Jefferson, Adams, Douglas, Larimer, Boulder, Weld, Pueblo), there are several instances where SCORE reflects voter registration rates close to or exceeding 100% of the *voting* population per the Colorado Demography Office. Additionally, *Exhibit 2* shows just how poor list maintenance has been as the majority of the the top 10 counties in Colorado by population (El Paso, Denver, Arapahoe, Jefferson, Adams, Douglas, Larimer, Boulder, Weld, Pueblo) continue to show growth in the voter rolls that doesn't align to growth in the voting population. If the Secretary of State's office can not even abide by basic list maintenance, how will they be able to take control of the administration of all counties' registration lists?

We also know that vulnerabilities in SCORE were verified when Synak conducted an ethical hacker crowd-sourced security program (**Synak SCORE Testing Paper**). Per the report, "the red team network discovered seven vulnerabilities in Colorado's election-related systems as well as the Secretary of State's official website". These discoveries were made after the Chief Information Officer at Colorado Department of State (Trevor Timmons) stated that his office already conducts regular vulnerability scans, as well as periodic audits of county election offices (**Colorado official details plans for penetration testing of election systems**). Additionally, through a Colorado Open Records Request (CORA), all IP addresses that directly accessed SCORE were obtained (**IP Address CORA Request**). The results of this CORA request can be seen in *Exhibit 3*. Another CORA request was made for additional technical information on SCORE, however, the request was denied (**Additional CORA Request Denied**).

Given the vulnerabilities noted above as well as the apparently numerous violations of law by the Secretary of State (Section 8 of the National Voter Registration Act of 1993 ("NVRA" or "Act"), 52 U.S.C. § 20507, C.R.S. 1-1-107(1)(d)-(e), C.R.S 1-1-107(5), and C.R.S. 24-21-101 to name a few), how can electors feel confident in the continued centralization of administration and power by the said Secretary of State? Specifically C.R.S. 1-1-107(5) states, "The provisions of this section are enacted, pursuant to section 11 of article VII of the state constitution, to *secure the purity of elections and to guard against the abuses of the elective franchise*." Continuing on the current course will only lead to the impurity of elections and additional abuses of the elective franchise.

Summary of Experience with Computer Systems
design, creation, installation, maintenance and management

1963 Introduced to computer systems by Bernard Galler at the University of Michigan. Part time job as systems operator - console operations, loading cards, mounting and dismounting tapes, folding and wrapping printouts.

1965 - BA degree from the University of Michigan in Mathematics – Probability and Statistics

1966 - Qualified as US Air Force Communications Officer.

1967-1969 Qualified as instructor and taught USAF Command and Control Computer Systems (called Management Information Systems in the private sector) utilized at the Pentagon and HQ of each major Air Command.

1969-1974 Manager of Large Computer (PDP-10) Software Support for Digital Equipment Corporation in Maynard, MA. Created Critical System Task strategy for software support and Minimum Standards for supportable software. Served as last resort problem solver for the most difficult PDP-10 customer computer system problems.

1975-1979 Project Manager for Datatrol, Inc. in Hudson, MA. Designed, sold, wrote specifications, implemented, and installed credit authorization systems for major department stores (e.g. Saks Fifth Ave., Dayton Hudson); totalizator (wagering) systems (West Palm Beach Jai Alai); computer systems to operate and manage government run lotteries (e.g. Massachusetts state lottery, lotto systems for 5 Canadian provinces). Wagering systems are high availability systems with significant penalties (> million $) for late deliveries or downtime.

1979-2007 Owner & CEO of Transaction Systems Inc. in Winter Park, FL. Designed and manufactured hardware and software for entertainment ticketing; designed and implemented communications protocol for supporting custom terminals on multi-dropped leased lines; manufactured, installed, operated, and maintained online systems for entertainment ticketing (Select-a-Seat, Ticketmaster) ; consulted on project management techniques to companies with computer projects just forming or in trouble (e.g. Utah Jazz, Southland (7-Eleven)).

2008-present Owner & CEO of High Availability Management, LLC;   Designed and implemented software and management techniques that make small business systems high availability (max downtime 15 minutes and avoid total system failure).
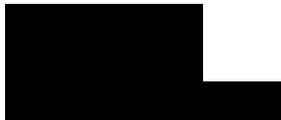

Ed Arnos Objections to Proposed Rules

Rule 1.1.29 - "ELECTION PROJECT BACKUP" MEANS A SET OF FILES THAT IS GENERATED BY THE VOTING SYSTEM SOFTWARE'S DEDICATED BACKUP/EXPORT FUNCTIONS AND VENDOR DEFINED PROCEDURES AFTER THE INITIAL PROJECT IS CREATED THAT CAN BE USED TO RESTORE THE VOTING SYSTEM TO A PREVIOUS STATE. THIS DOES NOT INCLUDE A FULL OR PARTIAL HARD DRIVE IMAGE OR CLONE.

"ELECTION PROJECT BACKUP" is a term specific to the Dominion Voting System. What records it includes are exclusively determined by DVS and are not under the control of the SOS or the COUNTY. Its purpose is to save the information that has been entered into an EMS that is associated with a particular election. It is analogous to saving a word document you are working on so if the power fails on the computer you do not have to start typing your document from the beginning you can recover the latest saved copy of the document.

An Election Project Backup will not include images of its own software, the operating system software, the MSSQL software, or any software packages it utilizes from other software vendors. It is not a comprehensive record of the instructions that were executed by the EMS to process an election. It will not allow an investigator to uncover cases where an operator or hacker altered tallies after they were calculated. It will also not uncover tallies altered by the EMS vendor's software. Only a disk image will provide the data to uncover those malicious actions.

Rule 11.4.2 - IF THE COUNTY'S VOTING SYSTEM DOES NOT EXPORT LOGS FROM THE ELECTION MANAGEMENT SYSTEM WHEN AN ELECTION PROJECT BACKUP IS CREATED, THE COUNTY MUST ALSO EXPORT THE LOGS FROM THE ELECTION MANAGEMENT SYSTEM FOR RETENTION ACCORDING TO RULE 20.10.2 AT THE TIME THEY CREATE AN ELECTION PROJECT BACKUP ACCORDING TO THE PROCEDURES DEFINED BY THE VOTING SYSTEM VENDOR.

This is difficult to achieve because it requires each COUNTY to be aware of the log files of the operating system and each application package operating on the EMS system. With system updates, the number of log files, their names, and locations can change. Implementing this substantially elevates the technical skill requirements of the COUNTY system operators.

Taking a disk image, or better yet, automated scheduling a disk image of all the relevant system disks provides the required election records without any COUNTY operator intervention and only requires updates when new disks or partitions are added to the system. See comments on Rule 20.10.3 for more info on disk images.

Rule 20.5.2 (A)(1) - ALL USERS WITH ACCESS TO THE VOTING SYSTEM MUST SIGN THE VOTING SYSTEM ACCEPTABLE USE POLICY AGREEMENT PROVIDED BY THE SECRETARY OF STATE EVERY

YEAR PRIOR TO USING THE SYSTEM.

& (B) EXCEPT FOR VOTERS USING A VOTING SYSTEM COMPONENT TO VOTE DURING AN ELECTION, COUNTY CLERKS MAY NOT ALLOW ANY PERSON TO ACCESS ANY COMPONENT, INCLUDING THE HARD DRIVE(S) OR COPIES OF ANY PART OF THE HARD DRIVE(S) FOR ANY COMPONENT, OF A COUNTY'S VOTING SYSTEM UNLESS: …

The Voting System is owned or leased by the County. The Secretary of State does not have jurisdiction over its use when an election is not in progress. An automated recertification script restores the system to a certified state prior to processing an election.

This rule can be used to exclude any 3rd party auditor. A 3rd party auditor, competent or incompetent, can only do damage to a machine by physically destroying it. This can be detected by hardware diagnostics confirming the hardware no longer operates correctly and the 3rd party auditor is responsible for repairing or replacing the hardware they damaged.

Restoring a "trusted build" disk image to the system disks and confirming no firmware has been altered, removes any hostile change to the system software or firmware.

The significance of allowing 3rd party audits is it demonstrates transparency that reduces public skepticism of the election system. Prohibiting 3rd party audits denies transparency and consequently increases public skepticism of the election system.

Rule 20.5.3 (A)(2) - THE COUNTY CLERK MAY NOT ALTER, OR GRANT PERMISSION TO ANYONE ELSE TO ALTER, EXCEPT DURING THE TRUSTED BUILD PROCESS, THE PRE-BOOT SETTINGS FOR ANY VOTING SYSTEM COMPONENT, INCLUDING ALTERING THE BOOT PATH.

The SOS has authority over the EMS when it is being used to manage an election. At any other time the SOS has no authority to say what can and cannot be done with the EMS.

This restriction:

1. **Does little to protect the system from a malicious attack.**
2. **Prevents repair when the system fails to boot.**
3. **Precludes installing multiboot systems which are valuable for allowing a backup computer to be preconfigured to replace any one of several computers in the system.**

Rule 20.5.3 (B)(2) - THE COUNTY CLERK MAY NOT CONNECT OR ALLOW A CONNECTION OF ANY VOTING SYSTEM COMPONENT TO THE INTERNET.

This is impractical as it precludes allowing technical people to diagnose hardware and software failures remotely. A County Clerk can enable an internet connection to a technician, monitor what the technician is doing to diagnose and correct the problem, disable the internet connection, and do an automated recertification of the system.

The SOS's authority in controlling the use of the EMS applies only when the system is managing an election. The County owns or leases the machine and can do with it what is most practical for the county when the system is not running an election e.g. rerunning Election Projects of their own or from other counties. Just before running the next election, the County runs an automated recertification script or restores a trusted build disk image and the EMS is recertified.

Rule 20.8.2 (D) A COUNTY MAY NOT ALLOW FOR THE ON-SITE REPAIR OR MAINTENANCE OF A VOTING SYSTEM COMPONENT THAT HAS TRUSTED BUILD SOFTWARE INSTALLED.

Only system disks have trusted build software installed. If a system disk fails that computer is useless for processing the election. In case of the Server or the NAS device the EMS is disabled until repaired. Replacement hardware and restoration of the most recent image for that device restores the system to a useful state that can be recertified and used to continue processing the election. This rule precludes the County Clerk from restoring an EMS to a certified state when a system disk fails.

Rule 20.10.3 - A COUNTY CLERK MAY NOT CREATE OR DISCLOSE, OR PERMIT ANY PERSON TO CREATE OR DISCLOSE, TO ANY PERSON AN IMAGE OF THE HARD DRIVES OF ANY VOTING SYSTEM COMPONENT WITHOUT THE EXPRESS WRITTEN PERMISSION OF THE SECRETARY OF STATE.

1. **This is a violation of CRS requiring each county election supervisor to preserve election records. If an election was managed using and EMS then a disk image of the system disk(s) from which a computer in the EMS could load software is a mandatory election record because it is requisite to determining how the EMS processed ballots, adjudicated ballots, and calculated tallies. Those disk images uniquely document the state of the computers and all events that occurred during the management of the election. An Election Project Backup procedure is inadequate record keeping to document how the EMS managed the election.**
2. **This also prevents creating images to quickly restore an EMS to the "trusted build state" in the event of system disk failure or accidental deletions.**
3. **This also prevents creating images daily during an election to document any changes in the state of the EMS while the election is being processed.**

Dominion Voting Systems formerly incorporated Acronis True Image disk imaging software as an application component of its EMS software. I would not have selected it because its developers were from a foreign country hostile to the US. I do not know why DVS removed it from their EMS software or why another vendor was not substituted but I view prohibiting disk images as a serious error as described in the 3 items above.

Issues not covered in the Rules

1. **Automating recertification of an EMS. It is possible to create a script to automate running of hardware diagnostics, confirming the digital signatures on software executables, confirming the state of any internet ports or enabled hardware devices, lists of connected devices on a LAN, etc. and flagging as errors any tests that failed to produce the desired result. This would permit each election supervisor to confirm their system is in a certified state and ready to run an election.**
It is also possible to wipe a disk(s) and restore the latest "trusted build" image(s) in order to return the EMS software to the certified state.
2. **Procedures to allow recovery from hardware failures quickly (remove, onfigure, and replace) and improve system availability.**
3. **Procedures to permit internet connections to diagnose system failures and then return the EMS to a certified state.**

A useful idea in protecting Election Integrity and reducing public skepticism concerning our election systems

A County Clerk is likely a good person trying to do their assigned task as best they can. When that is the case, providing them with the tools and flexibility to do that assigned task will increase Election Integrity and reduce public skepticism because empowering 64 clerks will generate more innovation and uncover more system and procedural flaws than constraining them to centralized control of procedures and actions.

County Clerks (and Secretaries of State) are human. Sometimes they are malicious or are the victims of a malicious person. Making rules will not constrain the malicious person. What is required is techniques to detect the malicious person and remove them. E.g. if an EMS has been altered to produce tallies different from the correct ones, rerun the election on a different EMS. This can be done by transmitting an Election Project over a secure VPN to other EMS's in the state and rerunning them by scripts to avoid consuming operator time and automating a comparison of the tally results. Doing this in 10 different locations will produce identical tally results or not. If not, examine the differences to reveal the locations where the tallies are incorrect. This will detect system operators or outside hackers accessing a machine and altering tallies.

It will not detect corrupt software from the software vendor. That requires processing the Election Project on software developed by groups interested in improving Election Integrity that develop their own Election Project processing software. Those groups are now easily identified and available.

These techniques and others can eliminate public skepticism about using computers to tally ballots.

None of these techniques eliminate fraudulent ballots. That requires dramatic changes in how we produce and distribute ballots. Fraudulent ballots are the easiest way for a malicious person to manipulate an election result and we have made that very easy to do in Colorado under the justification of increasing voter turnout.

Ed Arnos

Another approach to Objection to the Rules

May 23, 2022

The Rules being reviewed:

1. Fail to acknowledge disk images are election records required to be preserved by law.
2. Prohibit Clerks from taking disk images (Rule 20.20.3)
3. Fail to provide an automated means to recertify an EMS (Election Management System). Recertification is required as often as practical during an election to insure the EMS is in a certified state and immediately after any action that may have compromised the EMS.
4. Eliminate transparency of County EMS by prohibiting 3rd party audits.

1. Disk images and copies of system firmware are requisite election records. They document the instructions that computers used to process the election data and produce tallies. Without them, no one can prove that the tallies are accurate or accidently or deliberately inaccurate. As proof of their utility as evidence of events that occurred during an election, the Mesa County DA utilized the disk image taken by Tina Peters to refute allegations made in the 3rd Forensic Audit Report on the Mesa County disk image.

   The legal definition of election records does not exclude disk images of an EMS. It only specifies records it includes. When you trust a EMS to produce an election tally you must record the instructions it used to process the ballots and calculate a tally for each candidate and issue being decided.

   The "trusted build" overwrote the software that processed the 2020 election and erased the audit logs that recorded the commands issued to process the election and unanticipated errors and events that occurred on the EMS when the election was processed. It did this on every County EMS in Colorado running Dominion software. Overwriting election records can only be characterized as extremely ignorant or deliberately destroying evidence i.e. election records.

2. Prohibiting Clerks from taking disk images projects that EMS software must be kept secret. That projects that transparency will allow fraud to be detected. That increases public skepticism of the EMS and the entire election system.

   In addition, the current set of laws and rules is sufficiently complicated to intimidate a County Clerk into not doing anything with the EMS for fear of violating a rule. This is counterproductive to encouraging Clerks to confirm the system is operating correctly, or uncover flaws in the system and correct them, or any other use that is productive for the County.

3. A computer is a resource for solving many problems including removing any public skepticism about the EMS (e.g. using the EMSs after the election to rerun Election Projects on many different EMSs with many different operators and getting identical results). Certifying a computer system consists of running a series of tests to confirm the hardware is working and the software is the software that was tested and certified by well documented procedures. These tests are easily automated by a script (file containing a list of commands to be executed and what to do if an error (incorrect outcome) occurs). The SOS is the appropriate place to create the script because the SOS is responsible for certifying the EMS. In addition, the same script can be utilized at every County EMS. Once the script is available, the EMS can be recertified by invoking the script until there is an error free result.

4. 3rd Party audits are essential to implementing transparency of an EMS and reducing public skepticism about the election system in general. Competent audits reveal flaws in the EMS or in procedures that can be corrected before the next election or used to correct a tally before it is certified. Incompetent audit accusations are easily refuted with competent record keeping during the election.

    Restricting access to EMSs when they are not running an election is counterproductive to improving election integrity and reducing public skepticism. Restricting access is essential during the running of an election. BMD's should not be located in the same room as the EMS server and ballot scanners. Adjudication terminals should not be located in the same room as the EMS server and ballot scanners and not in the same room as the BMD's.

Ed Arnos

COMMENTS ON APRIL 15, 2022
PROPOSED RULES
8 CCR 1505-1
Submitted by Maurice Emmer, Aspen, Colorado
May 19, 2022 (Revised)

GENERAL COMMENT ON PROPOSED RULES:

The proposed rules ignore the statutory requirement in CRS 1-5-601.5 to comply with the Federal Election Commission's 2002 Voting System Standards (VSS). In fact, many aspects of the proposed rules conflict with the VSS. Nowhere is the VSS even mentioned in the rules' basis and purpose. Insofar as the proposed rules relate to electronic voting systems, they should be scrapped and rewritten with a principal objective of complying with the VSS.

COMMENTS ON SPECIFIC PROPOSED RULES

Rule 1.1.29 Defines "Election Project Backup" to exclude "a full or partial hard drive image or clone." The definition proposed includes only the files necessary to "restore the voting system to a previous state." Election officials are under a duty to preserve election records for specified periods under Colorado and federal law. Restoring an election system to a previous state at one point in time is not equivalent to preserving election records. Election records include the records necessary to reconstruct how an election was conducted, including how ballots were counted. That occurs over a period of at least weeks in Colorado, not one point in time.

Moreover, there is no legitimate purpose to exclude a hard drive image or clone. In fact, only by preserving a complete hard drive image can election officials ensure that all election records have been preserved as the law requires.

Colorado Secretary of State
May 19, 2022
Page 2

Accordingly, the rule and its definition restrict election officials in performing their statutory duties.

Rule 11.2.4   Requires a county to notify the Secretary of State if a license with a voting system vendor is terminated. This rule has no legitimate purpose. The Secretary of State has the duty to certify electronic voting systems if they have passed testing by a federal accredited voting system testing laboratory and if they otherwise comply with state law. Once so certified, counties may use any such certified system. It is the responsibility of the counties to use the system or not, as long as the system complies with state law. If such a system appears to be malfunctioning, the Secretary of State already required the county to notify her. Otherwise, the Secretary of State has no legitimate interest in being notified whether a license is terminated by a county,

The Secretary of State's past conduct, however, has indicated that she might abuse the power she seeks under this rule. In particular, when the Rio Blanco County Commissioners terminated their county's contract with its voting system vendor, the Secretary of State's employees made unfounded and false representations to the County Commissioners with the apparent intent of bullying them into reversing their decision. Moreover, written threats later were received from other sources making similar unfounded and untrue claims. It is reasonable to suspect, based solely on the coincidence of time, that the Secretary's personnel prompted such other threats.

Accordingly, based on experience, it appears that the Secretary's purpose in promulgating this rule is to enable her staff to harass county personnel.

Colorado Secretary of State
May 19, 2022
Page 3

Rule 11.4.2   Requires that backups of election projects include log files from the election management system (EMS). The EMS is the main software package running the electronic voting system. This requirement is inadequate to satisfy the Federal Election Commission's 2002 Voting System Standards (VSS), which are incorporated into Colorado law under CRS 1-5-601.5. The VSS require that all log files relevant to a potential audit of the processes, not merely the outcome, of an election held within the relevant record retention period be preserved.

Further, the rule easily could give counties the impression that their record preservation duties would be satisfied if they were to comply with this rule. That would be incorrect. The counties have independent record retention duties, including duties under the Colorado Open Records Act.

As it is well documented that the periodic "trusted builds" of Dominion Voting Systems destroys election records within the statutory retention periods, this rule is misdirected and dangerous. Rather, the rule should require complete imaging of all hard drives in a voting system.

Rule 20.5.3   Requires that wifi capability be disabled before use in an election. Wifi and other communications capabilities in electronic voting systems violate the FEC's 2002 VSS. The rule should echo the VSS and prohibit wifi, Bluetooth, and any other type of communications capability in any component of a voting system

Rule 20.5.6   Requires hard drives in electronic voting systems to be reformatted after a voting system license has been terminated. Reformatting hard drives destroys the ability to read and use election records, which the law requires be

Colorado Secretary of State
May 19, 2022
Page 4

maintained for statutory periods. Adherence to the rule would violate those statutory requirements. Moreover, the hard drives contain public records that are subject to disclosure under the Colorado Open Records Act. Instead, the Secretary should be requiring counties to create and preserve images of voting system hard drives.

Rule 20.10.2   Requires counties to maintain certain electronic records, but does not require retention of the log files of the electronic voting system operating system. Such log files should be required to be maintained, as they are necessary to reconstruct how an election was conducted and votes counted.

Rule 20.10.3   Prohibits the creation or disclosure of an image of hard drives of any election system component without the Secretary's written permission. This violates the Colorado Open Records Act. Many records on those hard drives are public and open to disclosure under CORA. The counties are the records' custodians, with independent duties to respond to and fulfill CORA requests. The Secretary has no authority to interfere with the performance of duties under CORA.

Moreover, the Secretary has no legitimate rationale to interfere with the creation or disclosure of images of voting system hard drives. The drives do not enable anyone to learn how any voter voted in any election. If the drives contain only the information they are supposed to contain, their only use could be to enable the public to confirm that elections were conducted legally. The Secretary has claimed that disclosure of the contents of the hard drives could enable "hackers" to interfere with elections. This is a disingenuous and preposterous excuse. First, images of the Dominion system hard drives already are widely available on the internet. Second, while claiming such images could enable hackers to interfere, the Secretary has claimed on

Colorado Secretary of State
May 19, 2022
Page 5

numerous occasions that Colorado's voting systems are impregnable to hackers.

Regardless of the foregoing, the hard drives contain public records that must by law be preserved and disclosed if requested under CORA. The Secretary has no authority to override those laws, and thus has no authority to grant or withhold permission.

Respectfully submitted,

Maurice Emmer
Aspen, Colorado

Case Number 2021CV033691 Denver District Court
AFFIDAVIT OF DALLAS SCHROEDER

Dallas Schroeder being duly sworn states upon oath:

1. I am over the age of 18 years and competent in all respects to testify. I make this affidavit based on personal knowledge.

2. I have served as Clerk and Recorder for Elbert County, Colorado, since 2013. I am a registered voter. I graduated from Milligan College in Tennessee with a double major in history and business. I was a self-employed entrepreneur for 18 years until I was appointed Clerk and Recorder of Elbert County in 2013. I was elected to the office in 2014, and I was re-elected in 2018.

3. Elbert County uses a computerized voting system that is leased from Dominion Voting Systems. The law requires that our voting system must be certified by the secretary of state, after a federally accredited testing laboratory has tested it. One of my official duties is to ensure that our voting system complies with state law.

4. Attached to this Affidavit as Exhibit A is a copy of the secretary of state certification of Dominion Voting Systems Democracy Suite 5.11-CO, which Elbert County used in the 2020 election. Exhibit A states, in pertinent part, that the voting system was tested by Pro V&V, a "federally accredited voting system testing laboratory."

5. In July of 2021, I was told that Pro V&V was not a federally accredited testing laboratory when it tested DVS Democracy Suite 5.11-CO. This information was concerning because, if our county voting system had been tested by a laboratory that was not a "federally accredited voting system testing laboratory," then our voting system potentially did not comply with state law, and it would be my duty to report the violation.

6. On or about April 30, 2021, I received an email from Jessi Romero, Voting Systems Manager for the secretary of state. A copy of the email is attached to this Affidavit as Exhibit B. The email informed county clerks and recorders that our voting systems were being scheduled for a "trusted build," which was a reinstallation of Dominion software, the new version called "Democracy Suite 5.13." The email instructed county clerks to, "Backup any election projects" before the "trusted build."

7. After I received Exhibit B, I was told that there was evidence that the "trusted build" process that was performed on Mesa County's Dominion voting system during May of 2021, had erased electronic files that were part of the 2020 election records. This information was concerning, because I have a legal duty to retain election records for 25 months after every election. The purpose of retaining the records is so that a proper audit of an election can be performed. I was concerned that the "trusted build" process might erase electronic election

records from the Elbert County elections systems, which would violate state law. I would have a legal duty to report any such violation.

8. On July 20, 2021, I received a Memorandum from Judd Choate, Elections Director for the Colorado Secretary of State. A copy of Mr. Choate's memorandum is attached to this Affidavit as Exhibit C.

9. Mr. Choate asserted in Exhibit C that Pro V&V was a federally accredited voting system testing lab.

10. Later, I looked at the Pro V&V Pro V&V certificate of accreditation that is attached to this Affidavit as Exhibit D. The certificate states plainly that that Pro V&V's certification expired February 24, 2017. Therefore, with all due respect to Mr. Choate, I believe my own eyes. It appears that Pro V&V was NOT federally accredited when it tested Dominion voting systems in 2019. Thus, I no longer can be confident that the Elbert County voting system meets required legal standards, including the 2002 VSS standards that are incorporated into Colorado election law.

11. I believe that I have a legal duty to retain and protect the Elbert County election records of the 2020 election. I also know that Exhibit B from the secretary of state's office instructed me to backup election project files before the 2021 "trusted build." Therefore, before the secretary of state and Dominion performed the 2021 "trusted build" on the Elbert County voting system, I made a forensic image of everything on the election server, and I saved the image to a secure external hard drive that is kept under lock and key in the Elbert County elections office.

12. The secretary of state completed its "trusted build" of the Elbert County voting system in August 2021.

13. I would like to hire an independent cybersecurity expert to make a forensic image of the Elbert County election server after the "trusted build," and compare it to the forensic image that I made before the trusted build. If 2020 election records that appear on the server before the trusted build, are no longer present after the trusted build, then I will know that the "trusted build" destroyed 2020 election records. In such case, I can fulfill my duty to report a violation of election law. If none of the 2020 election records were destroyed by the trusted build, then I can be confident that I fulfilled my legal duty to retain records of the 2020 election.

14. Unfortunately, new election rule 20.5.4 promulgated by the secretary of state, which became effective October 15, 2021, prohibits me from allowing an independent expert to access Elbert County election equipment. I therefore request that the court enter an order that nullifies the secretary's new rules, and that allows me to hire an independent consultant. I ask that the costs of such expert be paid by the secretary of state.

15. Before the promulgation of the secretary's new election rules, my office had exclusive authority to remove unqualified voters from the Elbert County voter registration rolls. Correcting voter rolls is an important function of county clerks and recorders, because in counties like Elbert with small populations, my staff and I know many of the voters, we hear about it when a voter moves or dies, and we can correct voter rolls accordingly. New rule 2.13.2 removes the exclusive authority of my office to correct voter rolls, and gives that authority to the secretary

16. In summary, the actions of Defendant Jena Griswold hindered me in the performance of my official duties in the following ways:

    a. The secretary certified the Elbert County system when it had not been tested by a federally accredited laboratory. As a result, I am unsure whether the voting system complied with legal standards at the time that votes were counted in the 2020 and 2021 elections. I do not know if the voting system complies with legal standards today.

    b. The secretary may have erased election records from the Elbert County server that I have a legal duty to retain.

    c. The secretary promulgated new election rule 20.5.4 that forbids me to allow an independent consultant to have access Elbert County election equipment. The new rule makes it impossible for me to determine if the Elbert County voting system meets legal standards, and if 2020 election records were erased from the system during the 2021 trusted build.

    d. The secretary's new rule 2.13.2 states in part: "In accordance with section 1-2-605(7), C.R.S., no later than 90 days following a General Election, the ~~county clerk in each county must~~ DEPARTMENT OF STATE, WORKING IN CONJUNCTION WITH COUNTY CLERKS, WILL cancel the registrations of electors:" I believe that this new rule contradicts C.R.S. §1-2-605(7), which gives county clerks exclusive authority to remove ineligible voters. The statute states in part: "the county clerk and recorder shall cancel the elector's registration record."

Further Affiant sayeth naught.

Re: Certification of DVS Democracy Suite 5.11-CO

Dear Mr. Ikonomakis:

In response to the Application for Modification of a Voting System dated June 6, 2019, as amended, and in accordance with section 1-5-608.5, C.R.S, please be advised that I hereby certify Dominion Voting Systems' Democracy Suite 5.11-CO voting system for use in the State of Colorado. County Clerks and Recorders may now separately apply for authorization to acquire, install and use the Democracy Suite 5.11-CO voting system, pursuant to section 1-5-613(2), C.R.S., and Election Rule 11.8.4.

My office examined the original and amended Applications for Modification of a Voting System and supporting documentation, including the associated technical data package. In addition, Pro V&V, a federally accredited voting-system testing laboratory, tested Democracy Suite 5.11-CO in accordance with the test plans my office approved on May 20, 2019 and May 23, 2019. My office also reviewed Pro V&V's test reports dated June 3, 2019 and June 7, 2019, and the Colorado requirements matrix completed and transmitted by Pro V&V on June 4, 2019. Based on this review, I conclude that Democracy Suite 5.11-CO substantially complies with the requirements of the 2002 Voting System Standards (VSS) promulgated by the Federal Election Commission, and the Colorado standards contained in sections 1-5-601.5, 1-5-615, and 1-5-616, C.R.S., and Election Rule 21.

I reserve the right to promulgate conditions of use in connection with the use by political subdivisions of the Democracy Suite 5.11-CO voting system, and to amend those conditions from time to time, in accordance with section 1-5-608.5(3)(b), C.R.S.

Sincerely,

Jena M. Griswold
Colorado Secretary of State

Good afternoon,

In advance of the upgrade to your voting system, I'm reaching out to provide guidance on how to prepare for our visit, and what procedures we all will be required to follow when we are onsite for your Trusted Build.

COVID-19

- CDOS staff has been fully vaccinated.
- Please find the attached document titled "COVID-19 Trusted Build Procedures_4.30.21" for a list of requirements that we all must follow.
- I would like to bring a few requirements from this document to your immediate attention:

  o "The number of Dominion and county staff will be limited based on the size of the room and the minimal amount of people required to complete the process in a safe and efficient manner."

  o "The Voting Systems Manager will advise the county and vendor of the maximum number of staff from each that may be present during the process."

    ▪ Adams, Arapahoe, Boulder, Denver, El Paso, Jefferson, Larimer, Weld:
      - Staff will be limited to 4 CDOS, 8 Dominion & 8 county staffers.
    ▪ All other counties:
      - Staff will be limited to 1 CDOS, 2 Dominion & 2 county staffers.

  o "No later than **one week** before the scheduled appointment, the county and Dominion must each confirm in writing (by email) the staff who will be present, and that they will adhere to these procedures during the trusted build installation. The Voting Systems Manager will not finalize a visit until confirmation is received."

    1. Please send me an email at any time up to one week before your scheduled Trusted Build stating that you will comply with the requirements listed in the document, and identifying the county staff members (by name and position) who will be involved in the Trusted Build.
    2. I will confirm by email that I have received your list of staff and that you will comply with the requirements.
    3. CDOS staff assigned to your Trusted Build will send you an email before your visit to confirm who will be onsite and other details.

  o "Only authorized state staff, county election staff and Dominion staff may be present during trusted build."

1

- The onsite installation of the Trusted Build is not the time for members of the public, representatives from the local parties, or county officials other than the Clerk & Recorder to observe or ask questions about the process or any of the disinformation being pushed about the election.
- If, when we arrive onsite, or during the process there are others present (beyond Dominion and county election staff that have been authorized, and the Clerk & Recorder) in the area where the Trusted Build will take place, we will move on to the next county. It will then be the responsibility of the Clerk and Recorder to ship equipment to Denver so it may be upgraded at a time that works for Dominion and CDOS. Once the equipment is upgraded, it will then also be your responsibility to ship the equipment back to your county.
- We are happy to communicate with anyone who has questions or concerns about the process at any time before or after your Trusted Build date.

Preparation & notes

- Backup any election projects on your voting system to removeable media before our arrival.
- Please have all equipment set up per the COVID-19 guidance before our arrival. For those who do not have the space to set up your entire inventory at one time, please have a plan to seal (if necessary) and swap equipment out.
- Remove the bezels from your Samsung ICXs, should you have them. You do not need to open the base of the ICX.
- QuickHash, Libre Office, and the Aegis drive software will be installed on your EMS client or express server.

Background checks

- Background checks for DVS and CDOS staff are attached to this email.

We look forward to seeing everyone again! It has been far too long. Please let me know if you have any questions.

MEMORANDUM

To: Colorado County Clerks and Election Administrators
From: Judd Choate, Colorado Elections Director
Date: Tuesday, July 20, 2021
Re: Background on Certification of Democracy Suite 5.13 Voting System Upgrade

---

This memorandum addresses recent false assertions concerning the Secretary of State office's "trusted build" of the Democracy Suite 5.13 voting system upgrade. The trusted build process installs a certified system upgrade. All eligible counties have completed, or are scheduled to complete, the Democracy Suite 5.13 voting system upgrade. We hope the information here will assist you in ongoing efforts to combat the misinformation circulating about our joint county-state process for the ordinary and routine upgrade of Colorado's voting system.

As you are aware, when a voting system is scheduled for upgrade, that upgrade is tested by a federally certified voting system testing lab ("VSTL") using both federal standards adopted by the Help America Vote Act ("HAVA") and state standards laid out in Title 1 of Colorado Revised Statutes. Any VSTL completing the certification of a voting system must itself also be accredited by the EAC prior to doing such work.

Colorado's current trusted build is installing the Democracy Suite 5.13 upgrade for those counties that use Dominion Voting Systems. The Democracy Suite 5.13 upgrade was successfully tested by Pro V&V, based in Huntsville, Alabama, a VSTL that was first accredited by the EAC on February 24, 2015. Pro V&V's testing of the Democracy Suite 5.13 upgrade followed earlier testing of the prior Democracy Suite 5.11 upgrade in 2019. Indeed, since 2015, the U.S. Election Assistance Commission has federally certified, and the Secretary of State's office has certified for use in Colorado, a combined total of 12 different versions of the Democracy Suite system, based on testing performed by Pro V&V. Throughout that time, Pro V&V has held a continuous, valid EAC VSTL accreditation.

As the EAC states explicitly on its website, Pro V&V's accreditation has been in effect since 2015, and at no time has that accreditation ever been revoked: "The EAC has never voted to revoke the accreditation of Pro V&V. Pro V&V has undergone continuing accreditation assessments and had [a] new accreditation certificate issued on February 1, 2021." (https://www.eac.gov/voting-equipment/voting-system-test-laboratories-vstl/pro-vv.)

The EAC also has confirmed that Pro V&V's accreditation did not expire at any time between February 24, 2015 and today, July 20, 2021. This includes, a period from 2017-2019, in which the EAC lacked a quorum of Commissioners. In that interim, because the EAC lacked a quorum, it was unable to act on a

Ma n Number	(303) 894 2200		TDD/TTY	(303) 869 4867
Adm n strat on	(303) 860 6900		Webs te	www.sos.state.co.us
Fax	(303) 869 4860		E ma	adm n strat on@sos.state.co.us

renewal of Pro V&V's accreditation, and as a result, the prior 2015 accreditation remained in force and in good standing. (Voting System Test Laboratory Program Manual, Version 2.0, § 3.8 - https://www.eac.gov/sites/default/files/eac_assets/1/28/VSTLManual%207%208%2015%20FINAL.pdf.)

Thus, the current trusted build of the Democracy Suite 5.13 upgrade follows both federal and state regulations, in that the VSTL was (and is) accredited to test voting systems to federal and state standards and the Democracy Suite 5.13, and its predecessor Democracy Suite 5.11, were certified to those standards.

I hope this clarifies that Pro V&V was (and is) an accredited VSTL and was (and is) operating on an active (not expired) accreditation during the entirety of the past six years.

If you have any questions about our office's trusted build process or the certification of the Democracy Suite 5.13 upgrade, please do not hesitate to contact me or other subject matter experts in the Elections Division at the Colorado Secretary of State's office.

Thank you for all you do to promote fair and secure elections in Colorado.

Date: 2/24/15

Acting Executive Director, U.S. Election Assistance Commission

EAC Lab Code: **1501**

Statement of Objections to Proposed Rule Changes, 8 CCR 1505-1

Hearing Date: May 24th, 2022

Shawn Smith

In the legislative declaration at CRS § 24-4-101.5, the Title, Article, and Part which mandate this rulemaking hearing by the Secretary of State to not only afford, but heed, public comment regarding the Secretary's proposed rule changes, the General Assembly of Colorado states:

"The general assembly finds that an agency should not regulate or restrict the freedom of any person to conduct his or her affairs, use his or her property, or deal with others on mutually agreeable terms unless it finds, after a full consideration of the effects of the agency action, that the action would benefit the public interest and encourage the benefits of a free enterprise system for the citizens of this state."

Without question, the Secretary's proposed rule changes fail that simple test, by restricting local control and transparency to citizens of their own elections, de facto depriving them of any reasonable basis for trust in their elections, or any reason for their election of local chief election officials. Her proposed rules do not benefit the public interest; they only benefit her consolidation of power in her own office. In direct response to the revelations resulting from the exposure of Colorado voting system information to highly-qualified, independent computer experts, the Secretary of State has attempted in her Rules and in legislative changes she has promoted, not to address the revelations of vulnerability and criminal violation of statute themselves, but to prevent the public from ever again having the opportunity to hear from independent sources of expertise whether their elections truly are the "gold standard." Within the past two years, in particular, the Secretary of State has careened toward a restructuring of Colorado's election system, supported by a derelict General Assembly majority, which demands that citizens allow voting system vendors and the Secretary of State to decide what is true, and to do so without the opportunity for citizens to exercise the scrutiny which must be the citizens' right, as sovereign.

Furthermore, the Secretary's continued assertion of counterfactual claims regarding the requirement to preserve as election records the complete audit trail information from computer-based voting systems, prescribed by Federal Voting System Standards mandated by Colorado statute, and the Secretary's apparently willfully deceptive or unfathomably ignorant assumptions regarding the sufficiency of the "safeguards" she has required, as well as her prior and sustained certification of voting systems which do not and cannot meet those voting system standards, and her introduction of uncertified, untested software to those certified voting systems, in violation of Colorado statute, as well as her reliance upon an unaccredited Voting System Testing Lab, all point to a fundamental incapacity on her part and in her office to secure the purity of Colorado elections and to safeguard the elective franchise. Her talking points, with respect to protecting voting rights, are fantastic. Her conduct, with respect to protecting voting rights, is abysmal and criminal.

Specific objections to these rules:

With respect to Rule 1.1.1, "active ballot" presumes that the digital ballot record of and all scanned ballots represent a given eligible voter's intent with a cast ballot, but Mesa forensic reports showed not only that the voting system does not comply with 2002 Voting System Standards, making the voting system illegal to certify for or use in Colorado elections, but that machine manipulation can change the results of adjudication, and canvassing showed that eligible voters' cast ballots may not be counted, and that ineligible voters cast ballots may be counted.

With respect to 1.1.17, "County" or "County Clerk" cannot mean "others employed or appointed by the County Clerk to carry out the duties of the County Clerk in the administration of an election" because CRS § 1-1-110(2) is explicit in authorizing only the "deputy clerk in the absence of the county clerk and recorder or if the county clerk and recorder for any reason is unable to perform the required duties." I.e., a County Clerk may task election officials, made so by their own declaration, within their respective County, but the Secretary of State may not authorize or empower any election official in a County in contradiction of CRS § 1-1-110.

With respect to Rule 1.1.21, the Secretary of State may not, in a Rule, expand the definition of "Secretary of State" to include "personnel employed by the Secretary of State," because CRS 24-21-105 is explicit in restricting the authority of the Secretary of State to appoint and authorize others to exercise the Secretary of State's authority, stating "The secretary of state may appoint a deputy to act for him if he deems it necessary, who shall have full authority to act in all things relating to the office. The secretary shall be responsible for all acts of such deputy." In other words, the Secretary may task personnel within her department, but may not authorize them to act in her place, e.g. to approve the certification of voting systems for purchase or use in Colorado, without explicitly and officially designating each of those personnel as a "Deputy."

With respect to Rule 1.1.23, the implicit assertion that the Secretary of State, or any other Election Official, has a right or the ability to "adjudicate" the intent of a voter who has mismarked, overmarked, or marked duplicate choices on a ballot, assumes the authority and capability of Election Officials in contradiction to CRS §1-7-309(1), which states "Votes cast for an office to be filled or a ballot issue to be decided shall not be counted if an elector marks more names than there are persons to be elected to an office or if for any reason it is impossible to determine the elector's choice of candidate or vote concerning the ballot issue." The Secretary of State has approved voting systems for purchase and use which not only have a digital capability to alter the ballot record, but for which the criteria to do so are variable and unverifiable by election judges and electors; no voting system may be used which enables or allows "adjudication" that includes the counting of votes from a ballot on which a voter had overvoted or undervoted, but voting systems certified by the CO Secretary of State have that capability.

With respect to Rule 1.1.29, the Secretary of State is attempting to establish a vendor-specific term, "Election Project Backup," as a mechanism for backup and preservation of election records, but that mechanism does not preserve all log files and other artifacts (including all operating system log files for any "COTS"-based component of a voting system running voting system software) identified as mandatory standards for audit trails in the 2002 Voting System Standards, which are a statutory minimum standard for voting systems in Colorado under CRS § 1-5-601.5. Restricting and impeding County Clerks from conducting full or partial hard drive images interferes with the discharge of their duty with respect to 52 U.S.C. §20701 and CRS §

1-7-802, which require the preservation of election records for 22 and 25 months, respectively. Any rule or order by the Secretary of State which interferes with the discharge of duty by election officials to take adequate steps to preserve all election records explicitly or implicitly identified in the 2002 Voting System Standards is a de facto violation of CRS § 1-13-701.

With respect to Rule 1.1.38, in requiring that observers be only either appointed by the Secretary of State or by the Federal government and approved by the Secretary of State, the Secretary of State proposes to violate 52 U.S.C §10305, which prescribes that observers may be appointed by a court and also by several agencies of the Federal government, with no provision that the appointed observers be approved by the Secretary of State. The failure of both the Secretary of State and the Colorado Attorney General to either notice or respect the Federal statute is ample evidence that an outside special counsel should be appointed by a court to review all rules and procedures enacted by the Secretary of State, to determine the full extent to which the Secretary of State has failed to abide, flouted, or violated Federal statutes.

With respect to Rule 1.1.47, if "Secure Ballot Area" does not include all ballot drop boxes and all facilities, vehicles, and locations (e.g. the vehicles and containers used by individuals retrieving ballots from ballot drop boxes, or all USPS facilities and vehicles involved in conveying cast ballots) within which cast ballots may be present after being marked by an eligible elector and prior to verification of the affidavit signature of an eligible elector, then those areas must be considered "not secure" and therefore not suitable or approved for use in elections.

With respect to Rule 1.1.48, copying of election files to and from memory cards and flash media and programming of voting system components both occur in Voter Service and Polling Centers where ballot-marking devices are used by electors, as well as in the area where smartcards are programmed for use at the ballot-marking devices to provide to electors, therefore those areas must, by this rule, be designated as "secure equipment areas," however new Rule 20.4 requires that the Counties restrict access to these designated "secure equipment areas," and doing so would restrict the access of eligible electors. Therefore Rule 1.1.48 and Rule 20.4, as proposed, violate the Civil Rights Act of 1960 and violate the Equal Protection clause of the U.S. Constitution by restricting in-person voters.

With respect to Rule 1.1.39, renumbered to 1.1.51, the assumption and assertion that a serially-numbered tamper-evident seal is adequate to either prevent or reveal tampering is faulty and without evidence, as numerous tutorials are publicly available which illustrate methods of successfully bypassing the tamper-evident seals without revealing that tampering has, in fact, occurred.

With respect to Rule 1.1.45, the inclusion of "mechanical, electromechanical, or electronic equipment (including the software, firmware, and documentation…) that is used to: …(4) Maintain and produce any audit trail information" as part of a "voting system" is illogical, overly broad, and illegal, in that it interferes with County election officials' authority and responsibility to preserve election records in the form of copies of electronic files generated on the voting system but separate from it. If the voting system can be operated without the copies, then it stands to reason that the copies are not part of the voting system. If the copies can be destroyed without affecting the operation of the voting system, then it stands to reason that the copies are not part of the voting system. If the copies cannot be used, in and of themselves, to duplicate the function of the voting system, then it stands to reason that the copies are not part of the voting system.

With respect to Rule 2.15.5, the Secretary of State has no authority to redefine or issue rules which modify the legislative intent of Article 72 of Title 24; her attempted restriction of "custodian" with respect to County Clerks ignores the "authorized person" aspect of CRS §24-72-202(1.1) and thereby exceeds her authority and violates CRS. Also, there is no "Part 21, Article 72 of Title 24, C.R.S." This level of inattention to or disregard for the law disastrously characterizes the Secretary of State's conduct with respect to election law and the rights of citizens under our Constittuion.

With respect to Rules 1.1.53, 1.1.54, 1.1.56, and 1.1.57 the Secretary of State proposes to count votes cast by an eligible elector for a candidate to another candidate; this explicitly violates both Federal and State statute by counting the votes differently than the eligible elector's cast ballot. Furthermore, the use of fractional vote counts and totals and the machine-transfer of votes between candidates impedes transparency in elections, depriving citizens of the Constitutional rights to free and fair elections and the transparency necessary to verify that freeness and fairness for themselves.

With respect to Rule 4.1.2, the proposed imposition of a requirement that translation be "culturally appropriate" is overly broad and ambiguous, and cannot thus be within the authority of the Secretary of State to either regulate or mandate.

With respect to Rule 4.8.2, the proposed imposition of a restriction on nicknames which "contain a political slogan or other political speech" is overly broad and ambiguous, subject to arbitrary determination by public officials, and therefore invites bias, and also restricts the inherent freedom of individual candidates to express themselves in accordance with the First Amendment. The Secretary must either allow nicknames or disallow nicknames, but may not exercise any authority to approve some nicknames and not others.

With respect to Rule 4.8.8 (B), the Secretary proposes inappropriately to require that a translator or interpreter "produces translations that are …culturally appropriate." The Secretary herself has no basis of certification or expertise to make that determination and must be prohibited from the assertion or exercise of the arbitrary authority she describes.

With respect to Rule 6.9, that the County must immediately inform the Secretary of State's office in writing in the event that an election judge is removed from duty by the County, the Secretary of State cites no statutory authority or purpose for the Rule, and her assumption of the authority to require that County officials notify her ignores CRS § 1-6-119 and the will and intent of the legislature, which has prescribed procedures for election judge removal and saw fit to assign no related authorities whatsoever to the Secretary of State.

With respect to rule 7.2.14, the entire exercise of determining which party's ballot an elector returned is unnecessary except for the imposition of the open primary, which invites the fraud of non-members of a political party having the opportunity to select the candidates of that political party, and involves the conflation of party candidate selection with the government function of conducting elections. The government should have no involvement whatsoever in the conduct of a partisan primary election, and should expend no government funds, and use no government resources, to conduct or assist in a partisan primary election. Providing for the indication or means for a county to determine, before opening a ballot envelope, which party's primary election ballot the elector returned, also provides a means for discrimination against voters of a particular party. Since the Secretary has procedures for handling the determination of which party's primary ballot was returned by an elector without the means of determination

before opening the envelope, the pre-opening means represents an unnecessary opportunity for discrimination against the voters of a particular party, which might occur at anytime during which the ballot envelope for a cast ballot is out of the elector's possession and not yet opened to be counted.

With respect to Rule 7.4.1, the requirement to "use a video surveillance recording system" to monitor each ballot drop box location is meaningless without the requirements that the video be of sufficient quality, resolution, and angle to ensure that anyone committing a crime involving the drop box can be identified, and also that 100% of the surveillance video for any election cycle be reviewed by election officials in the respective political jurisdiction, and made available to the public for their review, without the need for a request of any kind. Like the asserted "safeguard" of having paper ballots, the "safeguard" of having video surveillance is meaningless without compulsory, comprehensive review of the video for abnormalities and illegality; these are not safeguards, they are placebos.

With respect to Rule 7.10.3, the security rules promulgated by the Secretary of State under Rule 2.17/20.9.1(B) are grossly inadequate to protect the security of SCORE and the voter registration data contained therein, and thus represent a breach of duty under Title 1, enacted to secure the purity of elections and safeguard the elective franchise. Specifically, there is no basis for confidence that "county-controlled access to networks" or "proper network security controls" are sufficient, and WPA2 wireless security is an inadequate and vulnerable security standard, and no password should be shared, and the use of numbers and mixed case letters instead of increasing password length reflects outdated and ineffective password security standards. Furthermore, the fact that vulnerabilities were discovered in SCORE, exposing SCORE data to compromise and manipulation, in both 2015 and 2020, and that the Secretary of State never directed a comprehensive independent forensic examination to determine the extent of SCORE data compromise, reveals a disturbing neglect of fundamentals for security and auditing. The internal security controls for SCORE failed and, having failed, an independent auditor should have been engaged to conduct a comprehensive independent audit of SCORE to determine the results and impact of those discovered vulnerabilities.

With respect to Rule 7.16.3, the Secretary of State's requirement that VSPCs be arranged to ensure that election officials and other voters may not observe how a BMD voter marks or casts their ballot also necessarily allows for undetected access to the BMD that would allow the compromise of the BMD to exploit the vulnerability identified by J. Alex Halderman in his declaration in the Curling case in Georgia, and thus, exposes the voting system and the elections in Colorado to fraud and compromise.

With respect to Rule 8.10.2(7), the Secretary of State's elimination of logic and accuracy tests as an "election-related activity" subject to watcher access has no logical basis and has the effect of preventing or allowing the prohibition of watcher access to logic and accuracy tests which are, in any case, almost entirely useless to verify the proper and secure functioning of a computer-based voting system, since the entirety of the configuration and functionality of a computer-based voting system can be altered by a single-bit code change. At a minimum, witnesses to logic and accuracy tests should include all watchers, but also any other uncredentialed individuals as space limitations and safety codes allow. Furthermore, all election-related activity should be subject to uninterrupted video surveillance such that any member of the public can observe any aspect of the election-related activity at any time, since all citizens have equal right to know and observe the election activities for themselves.

With respect to Rule 11.4, the Secretary of State's insistence and prescription for backups of Election Database Projects and complete negligence to describe and specify backup of election records which would encompass all required files and data explicitly described under the 2002 Voting System Standards, reflects a breach of her duty to ensure the Federal and State statutes regarding election records are complied with, and her interference with the discharge of duty by county election officials. Her neglect of the statutory requirements includes but is not limited to failure to backup non-proprietary operating system files and logs from the election management system server, but also complete and utter neglect of the requirement to preserve log and audit trail records from other, non-EMS components of the voting system. Furthermore, because she has approved the certification of voting systems in the State of Colorado which, by design and configuration mandatory under her promulgated technical data for the voting systems, automatically and systematically deletes election records in the form of log files, the Secretary has ensured that all counties using those voting systems will violate both Federal and State statute.

With respect to Rule 11.4.3, requiring counties to submit hash values for election setup records files to the Secretary of State, the Secretary, knowing full well that she retains control over voting system BIOS passwords, and that voting system vendors retain supervisor account passwords, and that the voting system components are procured from overseas, without any supply-chain security whatsoever, and with inadequate hardware, software, and firmware security verification by Voting System Testing Labs, the personnel of which, in any case, have admitted in court records to possessing no particular cybersecurity expertise or background, implies and asserts that the voting systems are secure when, in fact, having had no supply-chain security whatsoever, and there being no standards in the applicable 2002 Voting System Standards, no in the standards for accreditation of Voting System Testing Labs, they can never be secured. The Secretary certifies and allows the use of unsecure and unsecurable voting systems, violating the Colorado Constitution, Article VII, Section 11, and violating the rights of Colorado citizens.

With respect to Rule 20.2.3(E), the Secretary inappropriately asserts an authority to restrict or prescribe restrictions on access granted by County election officials to Election Project Backups and the media containing them, and other copies of election records, but the preservation of these records involves a duty of election officials not subject to discernment or modification by the Secretary of State. Furthermore, the Secretary has demonstrated a profound ignorance of or disregard for the necessary and intended scope of these records, with respect to the explicit requirements for audit trail records described in the 2002 Voting System Standards and subsequent Voluntary Voting System Guidelines. Being that the Secretary is the individual who has destroyed and been responsible for the destruction of the greatest volume of election records in Colorado history, the People have no reason to entrust her office with access determinations related to each County Clerk's responsibilities as an election official.

With respect to Rule 20.3.2(B), and (D), the fact that majority of the computers and components in Colorado's certified voting systems were manufactured overseas, of overseas components, without any supply chain security whatsoever, and the absence of sufficient technical competency and proficiency in the Secretary of State's and county staffs, makes obvious the futility and inappropriateness of requiring county officials to pretend that they can train anyone to "detect tampering with voting equipment, memory cards, or election data."

With respect to Rule 20.5, the Secretary of State's proposed rules implicitly indicate that following the rules will result in the "security" of the voting systems; nothing could be further from the truth. The voting systems incorporate components manufactured in foreign countries, by foreign workers, of foreign components, with no supply chain security and no requirement nor capability on the part of either the Secretary of State or the Voting System Testing Labs to conduct any testing or component verification approaching adequacy to detect or mitigate compromises.

With respect to Rule 20.5.2(B), the Secretary of State inaccurately implies that a copy of a hard drive or any part of a hard drive, not incorporated into and necessary for the function and use of a voting system, comprises a "component" of the voting system. This is obviously inaccurate and unwarranted, and only technical illiteracy or a desire to extend her authority over functions and resources to which it does not pertain could motivate this assertion.

With respect to Rule 20.5.2(C), the Secretary's restriction on use for the Administrative User Account reflects the Secretary's awareness of the fact that the Administrative User Account is effectively a shared use account, and therefore that the Administrative User Account represents a violation of the 2002 Voting System Standards numerous clear requirements that no action on a voting system be unattributable to an individual user, e.g. in para 2.2.5, which requires that only identified users affect the system while election software is running, or para 3.2.3.1, which requires that voting systems shall accurately record all election management data entered by the user, and that "all systems shall: a. Record every entry made by the user."

With respect to Rule 20.5.2(C)(10), the Secretary of State's proposed rule that the Voting System Provider may not have administrative or user access to the county's election management system is unsatisfiable and unverifiable, since the Secretary has approved certification of voting systems which are built for remote access undetectable to local, including county, officials, including the incorporation of numerous wireless networking devices, central processing unit chipsets from Intel which incorporate what Intel calls "Active Management Technology," built for remote out-of-band access and configuration, and components such as the integrated Dell Remote Access Controller(iDRAC), again, built for the sole purpose of facilitating remote out-of-band management of the computer system and network, without either detection or approval of local officials and operators. Furthermore, the manuals for some voting systems certified by the Secretary of State for purchase and use in Colorado specifically identify supervisory access by voting system vendors which allows their employment of functionality and features on the voting systems neither accessible nor modifiable by election officials.

With respect to Rule 20.5.3(A)(1), the Secretary's rule that County Clerks must ensure wireless capability or devices in voting systems are disabled is impossible for Clerks to satisfy. In the first place, the Clerks do not have BIOS access, necessary to even verify that the devices are not being employed by nor are accessible to the operating system. In the second place, the hardware incorporated in the voting systems is designed to be able to employ embedded and connected wireless and other networking devices without reference to or awareness by the operating system. In the third place, as previously described, the total absence of supply chain security in the manufacturing of the voting system components and in the testing regime required for Secretary of State certification, means that not only do County Clerks have no ability to meet this requirement, neither does the Secretary of State.

With respect to Rules 20.5.3(C)(2)-(4), the Secretary of State requires that removable storage devices may not be connected to a voting system without first reformatting the device but the Secretary allows and instructs the counties to use the voting system vendor-provided reformatting application and permits the counties to connect a removable storage device, unreformatted, which has been connected to SCORE, which is already known to have been exposed to multiple vulnerabilities, and which has had no comprehensive independent audit to determine its integrity or security, or if the storage device contains files "remotely programmed by the voting system provider." This rule and the exceptions again illustrate either the Secretary of State's gross ignorance of the cyber threat to critical systems, or her blatant disregard for the best and recommended security practices to mitigate that threat. SCORE is not secure. Downloaded files from a vendor are not secure. Untested, uncertified vendor-proprietary software is unacceptable, from a security and election integrity standpoint, to ensure the security and integrity of the voting system. The Secretary makes no provision for and apparently has either no concern for or awareness of the possibility of portable code, hidden and encrypted partitions that may be present on removable storage devices, or the inability of either CDOS or county election officials to detect or mitigate the risks implied by those threats.

With respect to Rule 20.5.3(D), the Secretary of State has misinterpreted this, her own rule, to imply that she has authority to install software on a component of the voting system; she does not, except in accordance with Title 1, which requires all the same certification steps for the introduction of new software, regardless of whether it is vendor-recommended or Secretary of State-approved, as are required for a new system (testing for compliance w/Federal 2002 VSS standards, written approval by Secretary of State after review, etc). Furthermore, the "Department of State" cannot approve either a new voting system or a modification; only the Secretary or her Deputy may.

With respect to Rule 20.5.3(F) the Secretary of State again displays either ignorance or willful disregard for the threats posed to computer systems, by assuming that any USB device is safe to connect to a voting system; the massive, targeted, sustained campaign of supply chain attack and compromises employed by foreign nation states and the well-documented precedent of introduction of threats and malware into critical systems via counterfeit and modified hardware both indicate clearly that State and County personnel have no ability to discern hardware containing a covert wireless device from hardware without. Furthermore, having certified voting systems for sale and use in Colorado which incorporate as many as several dozen wireless devices per county, the Secretary's apparent knowledge that wireless devices are so risky that they must be prohibited is striking and inexplicable.

With respect to Rule 20.5.4(D) and (E), either the safeguard of two different individuals, with two different party affiliations, is required, or it is not; it makes no sense to require two different individuals with two different party affiliations for non-contract transportation, but to allow only a single individual with unknown party affiliation to transport the same voting equipment under contract.

With respect to Rule 20.5.6(C), the Secretary of State states that counties must preserve all election records on the voting system before reformatting, but the Secretary of State does not meet this same requirement when installing a "Trusted Build" modification to voting systems, wherein she reformats the hard drives of voting system components without ever having preserved the election records explicitly identified in the 2002 Voting System Standards as necessary to meet audit trail requirements.

With respect to Rule 20.6.2, the Secretary of State proposes to restrict the public from observing the conduct of a "Trusted Build" of voting systems, thereby depriving citizens of transparency into a vital election-related process which directly affects the exercise and preservation of their rights. There is no statutory authority for the Secretary of State to restrict public access, and her claim to do so under the umbrella of "security" is hollow and baseless. The General Assembly in Colorado has no authority except that delegated from the People. The Secretary has no authority except that provided by legislation passed by the General Assembly in accordance with their obligation under Colorado's Constitution to pass legislation to secure the purity of elections and safeguard the elective franchise. Depriving the People of transparency into their own election processes does neither, and asserts an absolute authority to the Secretary when, in fact, her authority is highly circumscribed and singular in its purpose.

With respect to Rule 20.6.3(B), the Secretary proposes that county clerks must ensure a trusted build is conducted under video surveillance, and also that no one may surreptitiously record the trusted build by video or audio; this is inherently self-contradictory, since, if the video surveillance must be maintained as an election record, per (B)(3), it must accessible to the public as a public record. The Secretary of State's rules imply that the Secretary does not believe she can or must trust County Clerks, but she demands that the People trust her. The People have no obligation to trust the Secretary of State and any interpretation of her authority which entails restrictions on the People's right to transparency in their elections must be null and void.

With respect to Rule 20.7.1, it makes no sense whatsoever to "secure" unvoted paper ballots when the Secretary allows use of paper ballots with no discrete security measures, e.g. serialized numbering, which would prevent the introduction of innumerable paper ballots prior to delivery to county election officials. The ballot is sent to UOCAVA voters as a pdf file. The ballot is sent to ballot printers as a pdf file. Anyone can take their own paper ballot and produce from it a pdf file which they may then use to reproduce the ballot.

With respect to Rule 20.8.1, the Secretary of State, by allowing a voting system provider to deliver election database and project programming, exposes certified voting systems to the introduction of uncertified code and malware; this violates and undermines the entire purpose of certification testing and the trusted build, which is to trust the certified post-test configuration, not the vendor which originally provided it to the Voting System Testing Lab.

With respect to Rule 20.8.2, the acceptance testing procedures prescribed by the Secretary of State are grossly inadequate to identify security compromises in the equipment and are thus the façade of security without the substance – they can only provide, at best, false assurance.

With respect to Rule 20.9.1, the Secretary's prescription of outdated and insecure WPA2 wireless network security, and shared wireless passwords, and mixed number/case letters password requirements all reflect a lack of knowledge of both cyber threats and best practices for mitigation; they are inadequate to secure SCORE.

With respect to Rule 20.10, the Secretary continues to assert, implicitly, that an Election Project is an adequate backup of all voting system election records required for preservation under Federal and State statute; it is not. It does not encompass all log files and other artifacts identified in the 2002 Voting System Standards as required for the audit trail of election conduct on the computer-based voting systems, not only because it does not include all required EMS server log files, but because it does not include all log files from thousands of other computers

used in Colorado voting systems. The Secretary's rules prohibit and restrict County Clerks from preserving all required election records from their voting systems and thereby illegally interfere with those County Clerks,' election officials in their own right and by the Federal statutory definition, discharge of their duties. In doing so, the Secretary violates the civil rights of Colorado citizens, who are entitled to free and fair elections, the safeguards that ensure them, and the transparency to verify all of it for themselves.

With respect to Rule 20.10.2(B), the Secretary explicitly states election records the county must preserve does not include "logs generated outside of the election management system software;" her exclusion of those logs, in fact, her failure to explicitly require preservation of those logs, violates both Federal and State statute, because the 2002 Voting System Standards are explicit in requiring the operating system logs from voting systems (including but not limited to the election management system) and in their purpose to provide the audit trail information described in the Department of Justice's 2021 Federal Law Constraints on Post Election Audits.

With respect to Rule 20.10.3, again, the Secretary restricts the ability of County Clerks to create images of their voting systems and provides not only no other mechanism for preservation of the election records on their voting systems, but explicitly prohibits them from preserving required election records, in violation of Federal and State statute.

With respect to Rule 20.12.2(3), the Secretary's proposed mandate that a county must cooperate, including providing any documentation or answers requested by the Department during the course of the Department's investigation, is overly broad and ambiguous. The county must, obviously, provide any documentation or answers to which the Secretary is entitled in accordance with her statutory authority circumscribed by the stated legislative and Constitution purpose of that legislation, but not any other. The Secretary has already previously demonstrated herself a poor, ignorant judge of the limits of her own authority and entitlement, and she cannot be trusted in this respect. In particular, the Deputy Secretary of State has already verbally confirmed, according the Mesa County District Attorney, his knowledge that the Department's investigatory powers are administrative and not criminal. Nor are they plenipotentiary. Any request for documentation or answers by the Department is circumscribed by the Secretary's authorities according to the General Assembly, and the General Assembly's authorities are circumscribed by the Colorado Constitution, which is clear regarding the retention of sovereignty by the People of Colorado.

With respect to Rule 21.11.6, the Secretary of State has authorized the violation of CRS 1-7-309 by certifying a voting system which allows adjudication of or refers ballots for scrutiny or election judge adjudication of overvotes. The only permissible adjudication of an overvote is "no vote." Furthermore, by allowing the voting system itself to determine which ballots must be referred for adjudication by election judges, the Secretary has in fact allowed the voting system itself to decide whether ballots must be adjudicated. The recent Mesa Forensic Report #3 documented an instance where the same ballot records were adjudicated differently by the same voting system; one instance is enough to know that it is possible and that it cannot possibly ensure equal protection of Colorado voters' civil rights.

Federal Law Constraints
on Post-Election "Audits"

Published July 28, 2021

The U.S. Department of Justice is committed to ensuring full compliance with all federal laws regarding elections. This includes those provisions of federal law that govern the retention and preservation of election records or that prohibit intimidation of, or interference with, any person's right to vote or to serve as an election official.

The Department is also committed to ensuring that American elections are secure and reflect the choices made on the ballots cast by eligible citizens. "The November 3rd election was the most secure in American history," according to a Joint Statement issued by federal and state officials and released by the federal Cybersecurity & Infrastructure Security Agency. In many jurisdictions, there were automatic recounts or canvasses pursuant to state law due to the closeness of the election results. None of those state law recounts produced evidence of either wrongdoing or mistakes that casts any doubt on the outcome of the national election results.

In recent months, in a number of jurisdictions around the United States, an unusual second round of examinations have been conducted or proposed. These examinations would look at certain ballots, election records, and election systems used to conduct elections in 2020. These examinations, sometimes referred to as "audits," are governed, in the first instance, by state law. In some circumstances, the proposed examinations may comply with state law; in others, they will not. But regardless of the relevant state law, federal law imposes additional constraints with which every jurisdiction must comply. This document provides information about those federal constraints, which are enforced by the Department of Justice.

Constraints Imposed by the Civil Rights Act of 1960

The Civil Rights Act of 1960, now codified at 52 U.S.C. §§ 20701-20706, governs certain "[f]ederal election records."   Section 301 of the Act requires state and local election officials to "retain and preserve" all records relating to any "act requisite to voting" for twenty-two months after the conduct of "any general, special, or primary election" at which citizens vote for "President, Vice President, presidential elector, Member of the Senate, [or] Member of the House of Representatives," 52 U.S.C. § 20701. The materials covered by Section 301 extend beyond "papers" to include other "records." Jurisdictions must therefore also retain and preserve records created in digital or electronic form.

The ultimate purpose of the Civil Rights Act's preservation and retention requirements for federal elections records is to "secure a more effective protection of the right to vote." State of Ala. ex rel. Gallion v. Rogers, 187 F. Supp. 848, 853 (M.D. Ala. 1960) (citing H.R. Rep. 956, 86th Cong., 1st Sess. 7 (1959)), aff'd sub nom. Dinkens v. Attorney General, 285 F.2d 430 (5th Cir. 1961) (per curiam). The Act protects the right to vote by ensuring that federal elections records remain available in a form that allows for the Department to investigate and prosecute both civil and criminal elections matters under federal law.   The Federal Prosecution of Election Offenses, Eighth Edition 2017 explains that "[t]he detection, investigation, and proof of election crimes – and in many instances Voting Rights Act violations – often depend[s] on documentation generated during the voter registration, voting, tabulation, and election certification processes." Id. at 75. It provides that "all documents and records that may be relevant to the detection or prosecution of federal civil rights or election crimes must be maintained if the documents or records were generated in connection with an election that included one or more federal candidates." Id. at 78.

The Department interprets the Civil Rights Act to require that covered elections records "be retained either physically by election officials themselves, or under their direct administrative supervision." Federal Prosecution of Elections Offenses at 79. "This is because the document retention requirements of this federal law place the retention and safekeeping duties squarely on the shoulders

of election officers." *Id*. If a state or local election authority designates some other individual or organization to take custody of the election records covered by Section 301, then the Civil Rights Act provides that the "duty to retain and preserve any record or paper so deposited shall devolve upon such custodian." 52 U.S.C. § 20701.

Therefore, if the original election official who has custody of records covered by the Act hands over those election records to other officials (for example, to legislators or other officeholders) or the official turns over the records to private parties (such as companies that offer to conduct "forensic examinations"), the Department interprets the Act to require that "administrative procedures be in place giving election officers ultimate management authority over the retention and security of those election records, including the right to physically access" such records. *Id*. In other words, the obligation to retain and preserve election records remains intact regardless of who has physical possession of those records. Jurisdictions must ensure that if they conduct post-election ballot examinations, they also continue to comply with the retention and preservation requirements of Section 301.

There are federal criminal penalties attached to willful failures to comply with the retention and preservation requirements of the Civil Rights Act. First, Section 301 itself makes it a federal crime for "[a]ny officer of election" or "custodian" of election records to willfully fail to comply with the retention and preservation requirements. 52 U.S.C. § 20701. Second, Section 302 provides that any "person, whether or not an officer of election or custodian, who willfully steals, destroys, conceals, mutilates, or alters any record or paper" covered by Section 301's retention and preservation requirement is subject to federal criminal penalties. *Id*. § 20702. Violators of either section can face fines of up to $1000 and imprisonment of up to one year for each violation.

Election audits are exceedingly rare. But the Department is concerned that some jurisdictions conducting them may be using, or proposing to use, procedures that risk violating the Civil Rights Act. The duty to retain and preserve election records necessarily requires that elections officials maintain the security and integrity of those records and their attendant chain of custody, so that a complete and

uncompromised record of federal elections can be reliably accessed and used in federal law enforcement matters. Where election records leave the control of elections officials, the systems for maintaining the security, integrity and chain of custody of those records can easily be broken. Moreover, where elections records are no longer under the control of elections officials, this can lead to a significant risk of the records being lost, stolen, altered, compromised, or destroyed. This risk is exacerbated if the election records are given to private actors who have neither experience nor expertise in handling such records and who are unfamiliar with the obligations imposed by federal law.

Constraints Imposed by the Federal Laws Prohibiting Intimidation

Federal law prohibits intimidating voters or those attempting to vote. For example, Section 11(b) of the Voting Rights Act of 1965 provides that "No person, whether acting under color of law or otherwise, shall intimidate, threaten, or coerce, or attempt to intimidate, threaten, or coerce any person for voting or attempting to vote, or intimidate, threaten, or coerce, or attempt to intimidate, threaten, or coerce any person for urging or aiding any person to vote or attempt to vote...." 52 U.S.C. § 10307(b). Similarly, Section 12 of the National Voter Registration Act of 1993 makes it illegal for any person, "including an election official," to "knowingly and willfully intimidate[], threaten[], or coerce[], or attempt to intimidate, threaten, or coerce, any person for . . . registering to vote, or voting, or attempting to register or vote" in any election for federal office. *Id.* § 20511(1)(A). Likewise, Section 131 of the Civil Rights Act of 1957 provides that "[n]o person, whether acting under color of law or otherwise, shall intimidate, threaten, coerce, or attempt to intimidate, threaten, or coerce any other person for the purpose of interfering with the right of such other person to vote or to vote as he may choose, or of causing such other person to vote for, or not to vote for, any candidate" for federal office. 52 U.S.C. § 10101(b).

The Attorney General is authorized to file a civil action seeking preventative relief, including a temporary or permanent injunction, against any person who engages in actions that violate these statutes. See 52 U.S.C. §§ 10308(d); 20510(a). And there are criminal penalties as well. *See, e.g., id.* § 10308(a); 18 U.S.C. §§ 241, 242, 594; *see generally* Federal Prosecution of Election Offenses, at 33-38, 49-54, 56-58.

Judicial decisions have established that voter intimidation need not involve physical threats. In certain contexts, suggesting to individuals that they will face adverse social or legal consequences from voting can constitute an impermissible threat. Here are a few examples of the types of acts that may constitute intimidation:

- Sending a letter to foreign-born Latino registered voters warning them that "if they voted in the upcoming election their personal information would be collected … and … could be provided to organizations who are 'against immigration'" was potentially intimidating. *See United States v. Nguyen,* 673 F.3d 1259 (9th Cir. 2012).

- Having police officers take down the license plate numbers of individuals attending voter registration meetings contributed to intimidating prospective voters. *See United States v. McLeod*, 385 F.2d 734 (5th Cir. 1967).

- Sending robocalls telling individuals that if they voted by mail, their personal information would become part of a public database that could be used by police departments to track down old warrants and credit card companies to collect outstanding debts could constitute intimidation. *See Nat'l Coal. on Black Civic Participation v. Wohl*, 498 F. Supp. 3d 457 (S.D.N.Y. 2020).

- Linking individual voters to alleged illegalities in a way that might trigger harassment could constitute intimidation. *See League of United Latin Am. Citizens - Richmond Region Council 4614 v. Pub. Int. Legal Found.*, 2018 WL 3848404, at *4 (E.D. Va. Aug. 13, 2018).

- Conducting a "ballot security" program in which defendants stand near Native American voters discussing Native Americans who had been prosecuted for illegally voting, follow voters out of the polling places, and record their license plate numbers might constitute intimidation. *See Daschle v. Thune*, No. 4:04 Civ. 04177 (D.S.D. Nov. 1, 2004).

See also United States v. North Carolina Republican Party, No. 5:92-cv-00161 (E.D.N.C. Feb. 27, 1992) (approving a consent decree in a case where the United States alleged that it violated Section 11(b) to send postcards to voters in predominantly African American precincts falsely claiming that voters were required to have lived in the same precinct for thirty days prior to the election and stating that it is a "federal crime to knowingly give false information about your name, residence or period of residence to an election official").[1]

---

[1] While voter intimidation need not involve physical threats, federal law of course prohibits using "force or threat of force" to intimidate or interfere with, or attempt to intimidate or interfere with, any person's "voting or qualifying to vote" or serving "as a poll watcher, or any legally authorized election official, in any primary, special, or general election." 18 U.S.C. § 245(b)(1)(A). The Deputy Attorney General recently issued Guidance Regarding Threats Against Election Workers.

There have been reports, with respect to some of the post-2020 ballot examinations, of proposals to contact individuals face to face to see whether the individuals were qualified voters who had actually voted. *See, e.g.*, Cyber Ninjas Statement of Work ¶ 5.1 (proposing to select three precincts in a large urban county to collect information from individuals through "a combination of phone calls and physical canvassing").

This sort of activity raises concerns regarding potential intimidation of voters. For example, when such investigative efforts are directed, or are perceived to be directed, at minority voters or minority communities, they can have a significant intimidating effect on qualified voters that can deter them from seeking to vote in the future. Jurisdictions that authorize or conduct audits must ensure that the way those reviews are conducted has neither the purpose nor the effect of dissuading qualified citizens from participating in the electoral process. If they do not, the Department will act to ensure that all eligible citizens feel safe in exercising their right to register and cast a ballot in future elections.

If jurisdictions have questions about the constraints federal law places on the kinds of post-election audits they can conduct, they should contact the Voting Section of the Civil Rights Division. If citizens believe a jurisdiction has violated the Civil Rights Act's election record retention and preservation requirements, or believe they have been subjected to intimidation, they can use the Civil Rights Division's online complaint form to report their concerns or call (800) 253-3931.
